S. N. D. NORTH, DIRECTOR

SPECIAL REPORTS

SUPPLEMENTARY ANALYSIS AND DERIVATIVE TABLES

TWELFTH CENSUS OF THE UNITED STATES: 1900

WASHINGTON

GOVERNMENT PRINTING OFFICE

1906

LETTER OF TRANSMITTAL.

DEPARTMENT OF COMMERCE AND LABOR,
BUREAU OF THE CENSUS,
Washington, D. C., March 1, 1906.

SIR:

I have the honor to transmit herewith a special supplementary report on the Twelfth Census, prepared under the supervision of Prof. Walter F. Willcox, of Cornell University, acting as a special agent of this Bureau, formerly chief statistician for methods and results at the Twelfth Census.

This report, portions of which have already been published as monographs in bulletin form, is in the nature of an analysis and interpretation of statistics contained in the main reports of the Twelfth Census—particularly of the statistics of population. Its preparation was authorized by my predecessor in office, Hon. William R. Merriam, in order to bring out the more significant features of figures presented in the extended tables of the reports of the Twelfth Census.

Portions of this report, the discussion of vital statistics, by Dr. J. S. Billings, the chapter on the negro farmer by Dr. W. E. B. Du Bois, and that on age statistics by Dr. A. A. Young, have been contributed by persons who are not in the Government service, but are specially qualified to deal with the topics assigned them. Other chapters, as those on illiteracy, interstate migration, and occupations, have been prepared mainly or entirely in the Census Bureau, by persons of special training recommended by one or another of the leading universities. Practically all the text, not otherwise credited, was written by Professor Willcox.

It is his request that special credit should be given to Dr. J. A. Hill, Mr. W. S. Rossiter, and Mr. G. D. Leslie for the loyal and efficient assistance they have rendered at various stages in the preparation of this volume.

Very respectfully,

S. N. D. North
Director.

Hon. VICTOR H. METCALF,
Secretary of Commerce and Labor.

5734—06——ii

PREFACE.

The present volume is a report from the division of methods and results, later merged in the division of revision and results, of the Census Office.

The law of March 3, 1899, under which the Twelfth Census was taken, provided for four inquiries "relating to the population, to mortality, to the products of agriculture and of manufacturing and mechanical establishments." It also provided for "five chief statisticians who shall be persons of known and tried experience in statistical work." Congress seems to have intended that one of the five statisticians should be assigned to each of the four inquiries, but nothing showed its intention regarding the fifth position. The Director of the Census tendered this position to the writer; it was accepted and a special division of the Census Office, the division of methods and results, was established and placed under his charge. The first plan was for this division merely to advise and cooperate with the other four in their work, but later the Director gave it a more independent field. The requirement of the law that the results of the four inquiries should "be published not later than the first day of July, 1902," made it certain that in the divisions of population and vital statistics there would be no time to make radical changes in the tabulations and lines of interpretation which had been employed in the previous census. The division of methods and results, therefore, was authorized to prepare a volume of derivative tables and critical interpretations of the Twelfth Census as a supplement to the reports originating in the other divisions, and of that authorization the present volume is the outcome.

It is sometimes alleged that a Government statistical office should stop short with the collection, tabulation, and publication of statistical material in tabular form, leaving the task of its interpretation to private individuals. The present volume has been prepared in the belief that it is part of the Government's duty to show what its figures mean. To be sure no interpretation can exhaust the meaning of the figures, and it then becomes a question what are the proper limits of an official commentary. The answer which thought and experience have slowly developed, and which this volume exemplifies, is that it is admissible to draw from the figures and to publish in a Government document inferences which would be accepted as almost certain by anyone competent to weigh the evidence, and which seem to be of general rather than of merely local interest or importance. It is believed that the interpretative work herein keeps within these limits.

The topics to be included were decided mainly by the results of preliminary studies, only such as proved of exceptional importance having been pushed to completion. Looking over the results, the writer suggests that in them a certain tendency and even unity may be discerned. Modern census work, based upon the individual return and tabulated by cards or slips, one for each person, has emphasized the individual as the main component or unit of society. For its purpose these units have formed larger units, such as states, cities, or counties, mainly as a result of local proximity. The picture of society which results is artificially simplified. It is true, but not the whole truth. Indeed, it is far from all the truth which census methods are adapted to reveal. The present report tends to supplement such a census picture by the study of social groups in which the bond of union is not exclusively or even mainly local proximity. The most important of these groups is the family, and the sections on the size of families, the marital condition of the population, and the proportion of children seek to throw some light upon this basis of our social life as a people. Groups of other sorts recognized in the report are persons bound together by community of race or community of occupation. Such work must be tentative, it must omit entirely many groups which might be studied with profit, and in any group selected the discussion must fall short of bringing to the surface all that the census figures mean. But possibly it may lead others to further and more adequate efforts in the same direction, and thus soon be superseded. Such an outcome would give no one more pleasure than the writer.

The derivative tables in the latter half of the volume include many which are not discussed in the text. It is believed that they carry their meaning on their face. Many of them indicate statistical differences between city and country—a basis of classification which, for many purposes, is more significant than the usual one between states or counties. In all these tables city totals for the United States and its divisions are given, and over against them are set country totals found by subtracting the city totals from those for the whole division, city and country included. A large number of ratio tables have also been introduced.

WALTER F. WILLCOX.

CORNELL UNIVERSITY, *March 1, 1906.*

SUPPLEMENTARY ANALYSIS

AREA.

SUMMARY OF RESULTS.

The total area of the United States, June 1, 1900, may be divided for convenience of statistical treatment into continental United States and the outlying districts, the latter including Alaska and the recent insular accessions of Hawaii, Porto Rico, the Philippine Islands, Guam, and Samoa.

The area of the United States, June 1, 1900, was 3,686,306 square miles, about one-fourteenth of the land surface of the earth.

Only three countries—the British Empire, the Russian Empire, and the Chinese Empire—have unquestionably a greater area than the United States. Whether the same is true of France depends upon the extent of territory in north Africa assigned to that country.

The five main geographic divisions of continental United States adopted by the Tenth Census—North Atlantic, South Atlantic, North Central, South Central, and Western—have been subdivided, as then suggested, into 11 minor groups of states and territories.

The average size of an American state is 65,827 square miles, which is larger than England and Wales (58,324 square miles), or Scotland and Ireland (62,401 square miles).

The average size of a state in the Atlantic divisions is 23,929 square miles; of a state in the Central divisions, 64,941 square miles; and of a state in the Western division, 106,886 square miles.

The United States is divided into 2,852 counties, and the area of 2,828 was measured by the Census Office.

The smallest county is Bristol county, R. I., with 25 square miles; the largest, Custer county, Mont., with 20,490 square miles, and the average area of a county is 1,050 square miles or about the size of Rhode Island.

But half the counties are less than 615 square miles in area, and the most usual size is from 400 to 650 square miles.

There are 39,391 primary subdivisions of counties or minor civil divisions. Their average area is 69.3 square miles, but probably half of these are less than 45 square miles in area.

The country has been divided into 19 physiographic divisions, the boundary lines of which have been made to coincide with county boundaries. These divisions differ one from another in physical characteristics, and it is possible that their inhabitants differ in characteristics measured by the Census.

DISCUSSION OF AREA.

Definitions.—The Twelfth Census was the first in American history at which important new territory had been added to the United States between the enactment and the execution of the census law. The law[1] was passed March 3, 1899. Under its terms the census extended over the whole area of the United States as it stood at that date, namely, all on the mainland of North America and Hawaii. But before June, 1900, when the fieldwork was done, the boundaries of the country were widened by the treaty between the United States and Spain,[2] adding the Philippine Islands, Porto Rico, and Guam, and the convention between the United States, Germany, and Great Britain,[3] adding "the island of Tutuila and all other islands of the Samoan group east of longitude 171° west of Greenwich."

No one of these accessions was included in the Twelfth Census. But a census was taken of Porto Rico in 1899, and of the Philippine Islands in 1903, leaving Guam and Samoa as the only parts of the United States without a census in the five-year period from 1899 to 1903. But for the wild tribes of the Philippine Islands only the total population (647,740) was reported by the census, giving, with the estimates for Guam and Samoa, 662,840 as the entire population for which no detailed information is available. This is less than 1 per cent of the population of the United States. In the present volume the phrase "United States" as generally used, refers either to the entire population under the American flag, June 1, 1900, or all that population except the wild tribes in the Philippine Islands, and the inhabitants of Guam and Samoa. The former meaning is used only in the sections on area, population, and density of population; the latter is used in other parts of the report.

The United States in either sense is divisible, for statistical purposes, into two parts –that part lying on the mainland of North America south of 50° north latitude, and the remainder. The former will be termed in this report continental United States, the latter the outlying districts. Alaska is strictly both outlying and continental, but the important statistical differences between it and the rest of continental United States have turned the balance in favor of classing it with the outlying districts. These districts—namely, Alaska,

[3] Proclaimed February 16, 1900. 31 Stat. L., 1878.

Guam, Hawaii, the Philippine Islands, Porto Rico, and Samoa—differ widely one from another and from continental United States in location and climate, and in history, language, and religion; in fact, in nearly all the diverse elements of civilization. In comparison with their populations that of continental United States is homogeneous in history, language, traditions, and social customs. Even the physical surroundings and race characteristics of the people of continental United States are much less diverse than those of the people of the outlying districts. For these reasons the difference between continental United States and the outlying districts will be emphasized, and little attention paid to the United States as a whole, for which there is almost no trustworthy statistical information, or to the area of enumeration, which includes two of the outlying districts—Alaska and Hawaii—and persons stationed abroad in the military and naval service of the United States. The statistical information presented regarding continental United States will be supplemented by similar information regarding the outlying districts, as far as such information is available.

To grasp the full meaning of census figures regarding area, it is necessary to understand the somewhat technical definition of that term, and the way in which area is measured. Area means, not the number of square miles or other units of surface actually open to the air, but the number that would be open if the surface measured were smooth and even and lay at the level of the sea. It is not affected by the presence of ranges of mountains or by the mean elevation of the region. When Mr. Kipling describes a kingdom in the Himalayas, which was "four miles square, but most of the miles stood on end, owing to the nature of the country," he was writing popularly rather than by the card.

To measure the area of any large part of the earth's surface, such as a country, recourse is had to what is known to special students as the geoid, that is, an assumed mathematical body of the same shape and dimensions as those of the earth measured to the mean level of the ocean, and of a smooth or regular surface. The area of a square degree, or of that portion included between any adjacent parallels and meridians, on the surface of such a body may be computed with great accuracy by the aid of a mathematical formula.[1] In this way the area of each square degree lying entirely within a country may be obtained. The parts of degrees along the border are measured by aid of a planimeter. The sum of these square degrees and parts gives the total area of the country.

The area of the United States might be defined as all that part of the earth's surface over which the United States has jurisdiction. But the line over the ocean, delimiting the jurisdiction of the United States from the high seas, is one that can not be accurately defined, and therefore the area included between that line and the shore can not be measured. No authority attempts to determine the area of the United States to its jurisdictional limit on the side of the high seas. The area of a country bordering on the ocean means either the land surface and internal waters, or that area plus a certain part of the adjacent waters over which the country has jurisdiction. For statistical purposes the former is the only sound definition, because only the land surface is defined by natural boundaries, thus excluding the uncertain factor of personal judgment. The area of the United States, then, may be defined as the amount of land surface and internal waters subject to its jurisdiction, or, more accurately, as the area of the land and water included within the boundary where it runs over land or along narrow water courses which accurately fix its location, and within the water line, or line of mean high tide, where the jurisdictional boundary runs over large bodies of water.

United States.—Two measurements of the area of continental United States have been made and are still in use by different branches of the Government. One was made by the Census Office in 1881, and accepted with slight changes by the Eleventh and Twelfth censuses.[2] The other was made by the General Land Office in 1898.[3] According to the Census Office measurement, the land surface of continental United States is 2,970,230 square miles; according to the Land Office measurement, it is 2,972,584 square miles. The difference between the two results is 2,354 square miles, or less than one-tenth of 1 per cent. This shows the closeness with which results of independent measurements may agree when the boundaries in question have been accurately surveyed and mapped, and is an indication of the probable error of the maps used, or of either measurement. It is doubtful whether any census measurement, except, perhaps, certain ratios such as those of males to females, attains a higher degree of accuracy. But the Census Office states the water surface of continental United States as 55,370 square miles, while the Land Office states it as 120,095 square miles. The wide difference is witness merely, or mainly, to a difference between the two authorities regarding what

[1] The formula used both by the Census Office and by the General Land Office was "Area $= \frac{\pi}{360}$ (M′ − M) NRm sin ½ (L′ − L) cos ½ (L′ + L), in which M′ and M are the longitudes of the limiting meridians, M′ − M being in degrees or fractions of a degree; N is the normal to the middle latitude in miles; R the radius of curvature of the meridian at the middle latitude in miles; L′ and L the limiting latitudes; and m = 1.004285. The resulting area is in square miles." The formula was derived by F. De Y. Carpenter, and is discussed by him in an article on "The Area of the Square Degree" in Van Nostrand's Engineering Magazine, vol. 23, page 457, f. (Dec., 1880). See also Tenth Census, Extra Census Bulletin, "The Areas of the United States," by Henry Gannett.

[2] Tenth Census, Extra Census Bulletin, "The Areas of the United States," by Henry Gannett. Eleventh Census, Report on Population, Part I, page xxxiv, and Bulletin No. 23. Twelfth Census, Vol. I, page xxxii, and Bulletin No. 57.

[3] Department of the Interior, General Land Office, Annual Report, 1899, page 289. Annual Report, 1903, pages 197 and 198.

should be measured. Long Island sound, Nantucket sound, and the American portion of the Great Lakes are excluded by the Census Office but included by the Land Office. This difference of judgment accounts almost entirely for the difference in result.

The foregoing figures, it will be noticed, are for the area of continental United States. To find the total area of the United States as it stood June 1, 1900, the area of the outlying districts must be added. These have not yet been surveyed and mapped so accurately as to warrant division of their gross area into land surface and water surface and exclusion of the latter. No measurement of the area of the outlying districts has been published heretofore by the Census Office, except for Alaska, Hawaii, and the Philippine Islands. The areas of Guam and Samoa, contained in the following table, have been measured in the Census Office for this report; for Porto Rico the measurements made by the Coast and Geodetic Survey have been accepted as most trustworthy.

TABLE I.—*Area of the United States about 1900.*

DIVISION.	AREA IN SQUARE MILES ACCORDING TO—	
	Census Office.	Land Office.[1]
United States	3,686,306	3,725,618
Continental United States[2]	[3] 2,970,230	2,972,584
Alaska[4]	[5] 590,884	599,446
Hawaii[4]	[5] 6,449	6,740
Philippine Islands[4]	[6] 115,026	143,000
Porto Rico[4]	[7] 3,435	3,600
Guam[4]	[8] 201	175
Samoa[4]	[8] 81	73

[7] Following unpublished measurement of Coast and Geodetic Survey, reported to Census Office under date of January 18, 1902, and giving provisional results from the survey of the coast line now in progress.
[8] Measured in Census Office from Hydrographic Office Charts, No. 87 and No. 1748.

The area of the United States, therefore, is more than three and two-thirds million square miles, or about one-fourteenth of the entire land surface of the earth. Its extent may be better appreciated on comparing it with other countries of great size. As many of them include much unsurveyed and ill-defined territory in Africa, Asia, or South America, the total area can seldom, if ever, be stated with accuracy—a fact that explains the wide divergencies between the two authorities quoted in the following table.[1] It includes all independent states assigned, by either authority, at least 1,000,000 square miles of land surface. The countries are arranged in order of size, as given in the English work.

TABLE II.—*Area of countries having at least 1,000,000 square miles.*

COUNTRY.	AREA IN SQUARE MILES ACCORDING TO—	
	Statesman's Yearbook, 1904.	Hübner's Geographisch-Statistische Tabellen, 1904.
British Empire	11,516,821	11,813,820
Russian Empire	8,660,395	8,589,120
France	4,296,130	3,355,628
Chinese Empire	4,277,170	4,300,892
United States	3,693,448	3,740,492
Brazil	3,218,130	3,228,445
Ottoman Empire	1,622,080	2,352,707
German Empire	1,236,650	1,234,551
Argentina	1,135,840	1,114,182
Total	39,656,664	39,729,837

These countries include between two-thirds and three-fourths of the entire land surface of the earth. The table shows that three of them—the British Empire, the Russian Empire, and the Chinese Empire—are larger than the United States. The two authorities differ regarding the comparative size of France and this country, the Yearbook making the former decidedly larger and the Tabellen making it slightly smaller. The difference is due mainly to the fact that the Yearbook includes among the possessions of France 1,544,000 square miles in the Sahara region of Africa not so included in the Tabellen.

The gross area (land and water surface) of the United States in 1790 and 1800 was 843,799 square miles.[2] In 1900 it was 3,741,676,[3] or four and one-half times as great.

States and territories.—Continental United States includes, as primary political subdivisions, 45 states, 4 territories, and 1 district. In order to have a brief phrase under which to embrace these divisions and also the several outlying districts, "states and territories" or "state or territory" will at times be applied to them collectively, although neither word, in its narrowest meaning, was applicable to the District of Columbia, Indian Territory, or any of the outlying districts at the date of the Twelfth Census.

In the following table the land surface of each state and territory in continental United States is given and the gross area of each outlying district, the states and territories being arranged in order of size from Alaska to the District of Columbia.

[1] In presenting these or other figures regarding foreign countries, the best secondary authorities have been followed, with no attempt to verify their statements, but two or more authorities are sometimes cited in order to indicate the variation between them and so the probable error of their results.

[2] Twelfth Census, Statistical Atlas, Table 2.
[3] Table 1 and text preceding.

TABLE III.—*Area of states and territories arranged in order of size: 1900.*[1]

STATE OR TERRITORY.	Area in square miles.	STATE OR TERRITORY.	Area in square miles.
United States	3,686,306	Alabama	51,540
		North Carolina	48,580
Alaska	[2] 590,884	New York	47,620
Texas	262,290	Mississippi	46,340
California	156,172	Louisiana	45,420
Montana	145,310		
New Mexico	122,460	Pennsylvania	44,985
		Tennessee	41,750
Philippine Islands	[2] 115,026	Ohio	40,760
Arizona	112,920	Virginia	40,125
Nevada	109,740	Kentucky	40,000
Colorado	103,645		
Wyoming	97,575	Oklahoma	38,830
		Indiana	35,910
Oregon	94,560	Indian Territory	31,000
Idaho	84,290	South Carolina	30,170
Utah	82,190	Maine	29,895
Kansas	81,700		
Minnesota	79,205	West Virginia	24,645
		Maryland	9,860
South Dakota	76,850	Vermont	9,135
Nebraska	76,840	New Hampshire	9,005
North Dakota	70,195	Massachusetts	8,040
Missouri	68,735		
		New Jersey	7,525
Washington	66,880	Hawaii	[2] 6,449
Georgia	58,980	Connecticut	4,845
Michigan	57,430	Porto Rico	[2] 3,435
Illinois	56,000	Delaware	1,960
		Rhode Island	1,053
Iowa	55,475	Guam	[2] 201
Wisconsin	54,450	Samoa	[2] 81
Florida	54,240	District of Columbia	60
Arkansas	53,045		

[1] For a similar table with alphabetical arrangement, see Twelfth Census, Vol. I, page xxxii. [2] Gross area.

The average area of these 56 states and territories is 65,827 square miles, or larger than England and Wales (58,324 square miles) or Scotland and Ireland (62,401 square miles). There are 20 larger and 36 smaller than the average. Perhaps the most noticeable break in the series is found between West Virginia and Maryland. There is no other point, except near the upper and lower limits, where a state or territory is more than double the area of the one next below it in size. Accordingly, the 56 states and territories fall naturally into three groups 20 large, comprising all above the average and all above 60,000 square miles; 13 small, comprising all with less than 10,000 square miles; and 23 of medium size, comprising those with an area of from 24,000 to 60,000 square miles.

The 13 small states and territories are either divisions close to the Atlantic coast north of the Potomac river, or islands; the 23 of medium size lie between the Atlantic ocean and the Mississippi river, or not far west of that river; the 20 large, except two outlying districts, Alaska and the Philippine Islands, lie in continental United States west of the Mississippi. As population has spread across the continent, the political units formed have been of greater average extent. If the area of each great physiographic division be divided by the number of states and territories it contains, the following results appear:

TABLE IV.—*Average area of a state or territory in the great physiographic divisions of continental United States: 1900.*

DIVISION.	Land surface in square miles.	Number of states and territories.	Average area of a state or territory.
Continental United States	2,970,230	50	59,405
Atlantic	430,723	18	23,929
Central	1,363,765	21	64,941
Western	1,175,742	11	106,886

The average area of a state or territory in the Central division is more than two and one-half times that on the Atlantic slope. The average area of a state or territory in the Western division is two-thirds greater than that in the Mississippi valley, and the excess would be more marked were it not that the largest state in the country, Texas, lies in the Central division as defined by the Census, and raises the average size in that group by nearly 10,000 square miles. The larger area of the Central and Western states is further illustrated in the following table:

TABLE V.—*Average area of a state or territory in the minor geographic divisions of continental United States: 1900.*

DIVISION.	Land surface in square miles.	Number of states and territories.	Average area of a state or territory.
Rocky Mountain	553,280	5	110,656
Pacific	317,612	3	105,871
Basin and Plateau	304,850	3	101,617
Western South Central	430,585	5	86,117
Western North Central	509,000	7	72,714
Eastern North Central	244,550	5	48,910
Southern South Atlantic	191,970	4	47,993
Eastern South Central	179,630	4	44,908
Southern North Atlantic	100,130	3	33,377
Northern South Atlantic	76,650	5	15,330
New England	61,973	6	10,329

In each of the three subdivisions of the Western group the average area of a state or territory is a little over 100,000 square miles. In the two Central groups west of the Mississippi the average area is between 70,000 and 90,000 square miles. In the two Central divisions east of the Mississippi, and also in the Southern South Atlantic, the average area of a state is between 40,000 and 50,000 square miles, while in New England the average area is but little more than 10,000 square miles.

The greater area of the Central and Western states may be connected with the larger scale on which the physical characteristics of the country in the valley and Cordilleran regions are built, and with the rapid improvement in means of communication during the nineteenth century, whereby a single government over large areas has been facilitated. It also registers, probably, a gradual growth away from that idea of local autonomy for small areas which was common and natural under the conditions preceding the American Revolution.

Counties.—In continental United States each state or territory is organized into a number of political divisions called in most states counties, but in Louisiana parishes, in Indian Territory nations, and in a few cases Indian reservations. There are a few independent cities of rank coordinate with counties. But as more than 95 per cent of these secondary political divisions are counties, this word will be used as a general designation for them all.

The number of counties in continental United States, June 1, 1900, was 2,852.[1] But the areas of only 2,828

[1] This number differs from the 2,867 given in Twelfth Census, Vol. I, Table XIV, page xxxvii, in the following particulars: It omits 9 in the outlying districts of Alaska and Hawaii, and 7 Indian reservations, 4 in South Dakota and 1 in each of the 3 divisions, Arizona, Minnesota, and North Dakota. On the other hand it treats the District of Columbia as a county. The differences are due primarily to the fact that the present count is made from the point of view of political divisions, while that in the first volume of the Twelfth Census is made from the point of view of population.

are given by the census.[1] The difference of 24 includes the 18 independent cities of Virginia, the area of which is not separately reported, and the 7 reservations in Indian Territory, which are given as a single area.

The counties of measured area range in size from Bristol county, R. I., with 25 square miles, to Custer county, Mont., with 20,490 square miles, or more than New Hampshire and Vermont combined. The average area is 1,050 square miles, or almost exactly the size of Rhode Island. But this average is greatly raised by the existence in the sparsely settled districts of 128 counties each having an area of more than 4,000 square miles. To minimize the influence of these abnormally large counties, the median area of the counties may be found, that is, the area of a county of such a size that the number larger is equal to the number smaller. The median area is 615 square miles. The average area is greater than the median by 435 square miles, or 70.7 per cent.

The following table gives the number of counties in the United States within specified limits of size:

TABLE VI.—*Number of counties within specified limits of size: 1900.*

LIMITS OF SIZE IN SQUARE MILES.	Number of counties within the limits.	LIMITS OF SIZE IN SQUARE MILES.	Number of counties within the limits.
0 to 50	5	700 to 750	139
50 to 100	16	750 to 800	85
100 to 150	23	800 to 850	93
150 to 200	54	850 to 900	111
200 to 250	72	900 to 950	82
250 to 300	98	950 to 1,000	73
300 to 350	107	1,000 to 1,050	54
350 to 400	153	1,050 to 1,100	46
400 to 450	240	1,100 to 1,150	42
450 to 500	165	1,150 to 1,200	27
500 to 550	184	1,200 and over	420
550 to 600	242		
600 to 650	168	Total	2,828
650 to 700	129		

The preceding table shows that the most usual or the typical area of a county is 400 to 650 square miles. Each of the five groups within those limits embraces more counties than any of the other groups of equal range, and together they include 999, or over a third (35.3 per cent) of the counties in the United States. The table shows that several groups separated by 150 square miles are unusually large, a reason for which may be found in the methods of county survey and county organization in the United States.

Minor civil divisions.—The 2,852 counties into which continental United States is divided are themselves subdivided, with few exceptions, into political divisions, to which collectively the Census Office has given the name of minor civil divisions in contrast to the major civil divisions, namely, the states or territories and the counties. These minor civil divisions in the different parts of the country pass under different names, such as towns, townships, hundreds, beats, precincts, districts, or plantations, and have widely different powers and duties. To the Census Office they are territorial divisions, and their population is reported separately.[2] At the date of the Twelfth Census there were 39,391 minor civil divisions in continental United States. The area of these divisions has not been measured by the Census Office, but their average area can be computed. It is 69.3 square miles. If the states are arranged in order of average size of a minor civil division, it will be found that more than half of these 39,391 minor civil divisions lie in states in which the average size of a minor civil division is less than 45 square miles. It seems probable that more than half the minor civil divisions in the United States are less than 45 square miles in area.

Table VII shows the number and average area of these minor civil divisions in the several states and territories. The average areas have been found by making of the numbers of minor civil divisions in the following table a series of divisors, and of the land surfaces given in Table III, diminished in a few cases by the area not returned by minor civil divisions, a series of dividends.

[1] Twelfth Census, Vol. I, Table XV, pages xxxviii–lvii, and Bulletin No. 57.

[2] Compare Twelfth Census, Vol. I, Table 5, pages 54–427.

TABLE VII.—NUMBER AND AVERAGE AREA OF MINOR CIVIL DIVISIONS: 1900.

STATE OR TERRITORY.	Number.	Average area in square miles.
Continental United States	39,391	69.3
North Atlantic division	5,467	29.7
New England	1,687	36.7
Maine	631	47.4
New Hampshire	245	36.8
Vermont	252	36.3
Massachusetts	353	22.8
Rhode Island	38	27.7
Connecticut	168	28.8
Southern North Atlantic	3,780	26.5
New York	974	48.9
New Jersey	424	17.7
Pennsylvania	2,382	18.9
South Atlantic division	4,575	58.7
Northern South Atlantic	1,107	69.2
Delaware	33	59.4
Maryland	272	36.3
District of Columbia	1	60.0
Virginia	458	87.6
West Virginia	343	71.9
Southern South Atlantic	3,468	55.4
North Carolina	958	50.7
South Carolina	434	69.5
Georgia	1,457	40.5
Florida	619	87.6
North Central division	17,381	42.1
Eastern North Central	6,602	37.0
Ohio	1,382	29.5
Indiana	1,016	35.3
Illinois	1,609	34.8
Michigan	1,288	44.6
Wisconsin	1,307	41.7
Western North Central	10,779	45.2
Minnesota	2,205	35.9
Iowa	1,654	33.5
Missouri	1,240	55.4
North Dakota	1,407	45.5
South Dakota	1,311	46.8
Nebraska	1,357	56.6
Kansas	1,605	50.9
South Central division	7,228	74.6
Eastern South Central	3,835	46.8
Kentucky	693	57.7
Tennessee	1,551	26.9
Alabama	1,216	42.4
Mississippi	375	123.6
Western South Central	3,393	106.1
Louisiana	455	99.8
Arkansas	1,246	42.6
Oklahoma	344	89.3
Texas	1,348	171.1
Western division	4,740	216.6
Rocky Mountain	2,106	245.6
Montana	271	413.8
Idaho	361	233.5
Wyoming	225	420.7
Colorado	330	124.9
New Mexico	419	292.3
Basin and Plateau	526	364.9
Utah	348	236.2
Nevada	178	616.5
Pacific	2,108	150.7
Washington	872	76.7
Oregon	699	135.3
California	537	290.8

The preceding table shows that the average size of the minor civil division is least in New Jersey, Pennsylvania, the three southern New England states, and Tennessee. Next in order come five states of the North Central group. The Northern states as a rule have smaller minor civil divisions than those in the South and the densely settled states smaller than the sparsely settled. Exceptional states are New York, where the minor civil division averages larger than in any of the New England states, even Maine, and much larger than in the states to the south of it; Delaware, where the minor civil division is over three times its average area in New Jersey and Pennsylvania; Virginia, where the minor civil division averages much larger than in any other Atlantic coast state except Florida; Mississippi, where the minor civil division is about three times its area in any adjoining state except Louisiana; and Washington, where it averages much smaller than in any other state or territory of the Western division.

The minor civil divisions in each state and territory of the Western division except Arizona, where they have not been returned, are larger than the average for the country. The same is true of Virginia, West Virginia, South Carolina, Florida, Mississippi, Louisiana, Oklahoma, and Texas. The average area of these minor civil divisions depends in part upon whether the village, city, or borough is a direct subdivision of a county or a subdivision of a subdivision. For example, in New York villages are not direct subdivisions of counties, but rather subdivisions of towns from which they were carved out on receiving their charter; but in Pennsylvania and New Jersey boroughs having the same statistical significance are subdivisions of the counties in which they lie. This accounts in a measure for the fact that the minor civil division in New York is more than two and a half times as large as it is in Pennsylvania or New Jersey.

GEOGRAPHIC DIVISIONS BY STATES.

Main geographic divisions.—Continental United States is too great to be treated as a unit; the states and territories too numerous and too diverse in size, population, and characteristics to meet all the requirements of statistics. This fact was recognized by the Census twenty years ago, and a plan for grouping the states and territories into five main divisions—North Atlantic, South Atlantic, North Central, South Central, and Western—reported in 1881 by the geographer

of the census, Mr. Henry Gannett, was adopted[1] and has been used ever since. The sketch map of continental United States given at the front of this volume shows the boundaries of these five divisions.

As the bulletin giving the reasons for this classification never was included in the census volumes, and is now out of print and difficult to find, its explanation is quoted at length. All statements of fact in the quotation refer to the conditions shown in 1880 by the Tenth Census.

As will be noticed, the country is divided primarily into three great divisions: the Atlantic region, the region of the Great Valley, and the Western or Cordilleran region, corresponding to the three primary topographical divisions of the country. Each of the two eastern divisions is divided by a line approximately east and west. This line between the two sections of the Atlantic division follows Mason and Dixon's line; that between the two sections of the Great Valley follows the Ohio river and the south boundary of Missouri.

This east and west line separates districts that are very sharply distinguished from one another by population, social conditions, and interests, as well as climate. The different conditions of rainfall and temperature upon the two sides of this line are too well known to require explanation.

From a historical point of view the divisions are characteristically different. The two Atlantic sections comprise the original thirteen states, with those formed from them, namely, Maine, Vermont, and West Virginia, with the single addition of Florida. They were settled during the colonial period, and may be said to represent that stage of our progress. The two divisions of the Great Valley have been settled almost entirely since the country became independent of Great Britain, and may properly be regarded as representing the stage of our progress from the time of our independence up to the present day; while the West is still, as far as development is concerned, in its infancy, and may properly represent the development of the future.

The North Atlantic and Northern Central sections are sharply distinguished from the two southern sections by the character of the population. The two former contain not less than 85.8 per cent of the foreign population, while, on the other hand, the two latter contain 90.5 per cent of the negro element.

In regard to material interests, similar marked differences exist. The North Atlantic section comprises, as its primary interest, a large proportion of the manufactures of the country. The Northern Central section, although also comprising a considerable portion of the manufactures, especially in its eastern part, still is dependent upon agriculture as its primary interest; and, among the various branches of agriculture, mainly upon the culture of cereals, not less than 71 per cent of the cereals of the country being produced in this section. The two southern sections are almost purely agricultural, and of the various branches of agriculture 99.6 per cent of the cotton and all the sugar cane and rice produced in the country are grown here. In the distribution of urban and rural population similar marked differences are to be observed. In the North Atlantic section the urban population forms a very large and powerful class, and evidently soon will be the governing element. In the Northern Central section, while the urban population still forms a considerable proportion, it is by no means a controlling element; and in the two southern sections the controlling interests are almost entirely those of the rural population. Out of a total number of 580 cities and towns of 4,000 population and over in the United States, comprising 12,936,110 population, 266, comprising 6,960,776 population, are found in the North Atlantic section, and 213, comprising 3,663,843 population, in the Northern Central section, while in the two southern sections combined there are but 78 cities and towns, comprising only 1,825,832 population.

In respect to civil organization, there are also very decided differences between the two northern and the two southern sections. In the two northern sections the township system of government obtains, with the exception of the state of Nebraska and a few counties in southern Illinois, while in the two southern sections, without an exception, the county system of government is the one in use. The Western section is distinguished from the others by its topography, comprising as it does the great western plateau, with the accompanying arid climate, light rainfall, and great extremes of temperature; by its present sparse settlement; and by the occupations of the inhabitants, which are mainly confined to mining and stock raising.

The area of these five main divisions of continental United States, and the per cent that each makes of the total, are stated in the following table:

TABLE VIII.—*Area of the main geographic divisions of continental United States: 1900.*

DIVISION.	Land surface in square miles.	Per cent of total.
Continental United States	2,970,230	100.0
North Atlantic	162,103	5.5
South Atlantic	268,620	9.0
North Central	753,550	25.4
South Central	610,215	20.5
Western	1,175,742	39.6

The preceding table shows that the Western division includes nearly two-fifths, the North Central about one-fourth, the South Central about one-fifth, the South Atlantic about one-tenth, and the North Atlantic about one-twentieth of the area of continental United States. By combining the two Atlantic and the two Central groups three divisions are obtained, which correspond about as closely as state lines admit to the great physiographic divisions, namely, Atlantic, Central or Mississippi valley, and Western or Cordilleran. The area of each and its proportion of the total are stated in the following table:

TABLE IX.—*Area of the great physiographic divisions of continental United States: 1900.*

DIVISION.	Land surface in square miles.	Per cent of total.
Continental United States	2,970,230	100.0
Atlantic	430,723	14.5
Central	1,363,765	45.9
Western	1,175,742	39.6

The Atlantic group is about one-seventh, the Central group about four-ninths, and the Western group nearly two-fifths of the area of continental United States.

From Table VIII, by combining the two northern and the two southern groups, one obtains the area of the two sections, the antagonism between which was a conspicuous feature of American history during the nineteenth

[1] Tenth Census Bulletin No. 277.

century. The Northern states have a land surface of 915,653 square miles, the Southern of 878,835, the former exceeding the latter by 4.2 per cent. Together they embrace at present rather less than half the area of the United States, including the outlying districts.

Minor geographic divisions.—Bulletin No. 277 of the Tenth Census, already quoted, closes with the following paragraph:

> This scheme is susceptible of still further subdivision, as may be required for various purposes. New England will undoubtedly remain a distinct subdivision, while at the same time regarded as a portion of the North Atlantic section. The Northern and Southern Central divisions might properly be separated along the line of the Mississippi river. On some accounts a subdivision of the West is advisable, separating it, perhaps, into what might be denominated the Rocky Mountain region, the Plateau region, the Great Basin region, and the region of the Pacific.

For the present report the foregoing suggestion has been adopted, and after conference with the geographer the five main divisions of continental United States have been subdivided into 11 minor divisions by breaking the Atlantic and Central divisions each into two and the Western division into three. In the map forming the frontispiece of this volume the boundaries of the main divisions are indicated by heavy lines, and the subdivision of the main divisions into minor divisions is indicated by lighter lines. In most cases the minor division has been so named as to indicate the larger division of which it forms a part. The states falling into each division, main and minor, appear in the following list:

Main and minor geographic divisions of continental United States, with states and territories included in each.

NORTH ATLANTIC DIVISION.

New England.	Southern North Atlantic.
Maine.	New York.
New Hampshire.	New Jersey.
Vermont.	Pennsylvania.
Massachusetts.	
Rhode Island.	
Connecticut.	

SOUTH ATLANTIC DIVISION.

Northern South Atlantic.	Southern South Atlantic.
Delaware.	North Carolina.
Maryland.	South Carolina.
District of Columbia.	Georgia.
Virginia.	Florida.
West Virginia.	

NORTH CENTRAL DIVISION.

Eastern North Central.	Western North Central.
Ohio.	Minnesota.
Indiana.	Iowa.
Illinois.	Missouri.
Michigan.	North Dakota.
Wisconsin.	South Dakota.
	Nebraska.
	Kansas.

SOUTH CENTRAL DIVISION.

Eastern South Central.	Western South Central.
Kentucky.	Louisiana.
Tennessee.	Arkansas.
Alabama.	Indian Territory.
Mississippi.	Oklahoma.
	Texas.

WESTERN DIVISION.

Rocky Mountain.	Basin and Plateau.	Pacific.
Montana.	Arizona.	Washington.
Idaho.	Utah.	Oregon.
Wyoming.	Nevada.	California.
Colorado.		
New Mexico.		

The area of these minor divisions, and the per cent that each makes of the total for continental United States, are stated in the following table:

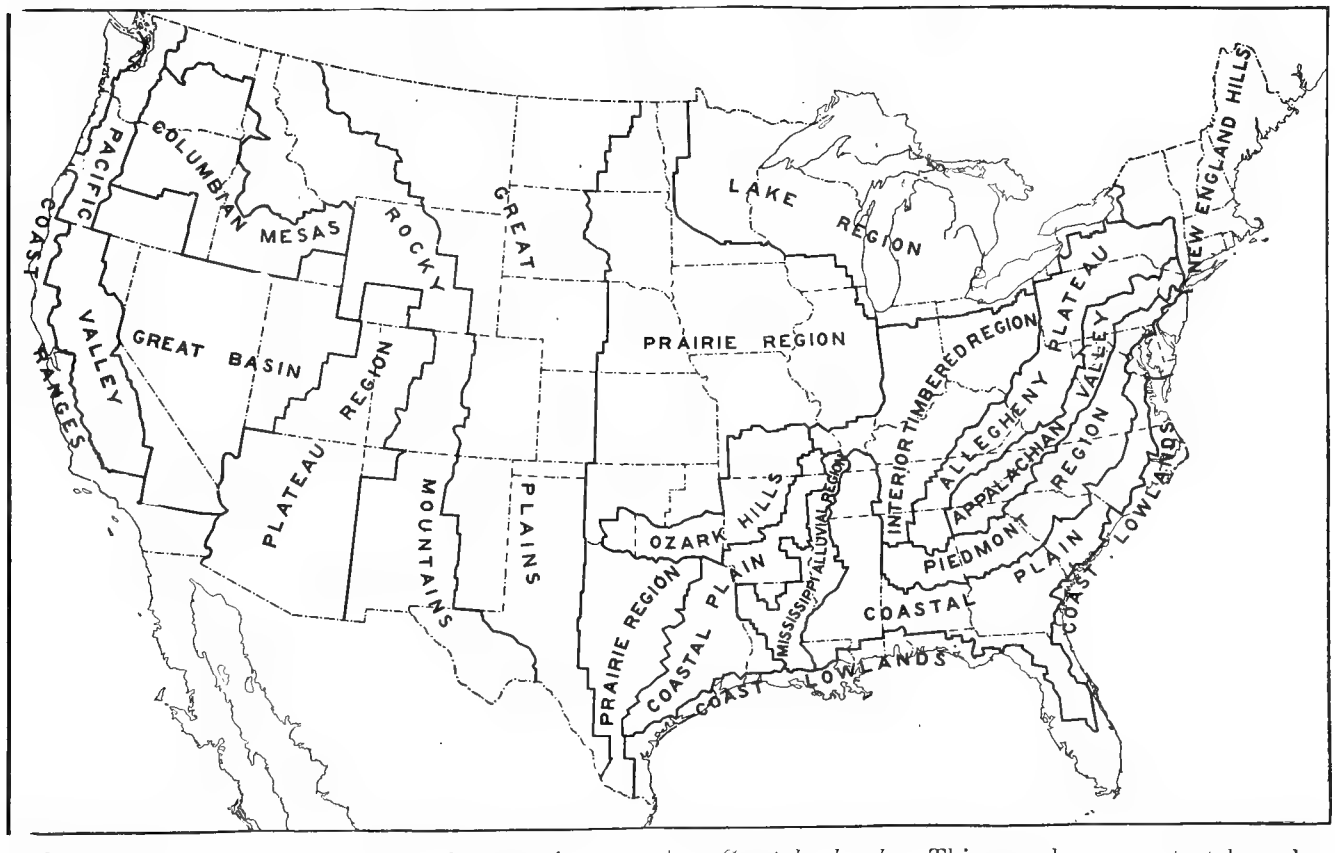
TABLE X.—*Area of the minor geographic divisions of continental United States: 1900.*

DIVISION.	Land surface in square miles.	Per cent of total.
Continental United States	2,970,230	100.0
New England	61,973	2.1
Southern North Atlantic	100,130	3.4
Northern South Atlantic	76,650	2.6
Southern South Atlantic	191,970	6.4
Eastern North Central	244,550	8.2
Western North Central	509,000	17.2
Eastern South Central	179,630	6.0
Western South Central	430,585	14.5
Rocky Mountain	553,280	18.6
Basin and Plateau	304,850	10.3
Pacific	317,612	10.7

Of these 11 groups, New England is the smallest, containing about one-fiftieth, and the Rocky Mountain group the largest, containing one-sixth, of the whole. Of the six divisions lying east of the Mississippi every one contains less, and of the five divisions lying west of the Mississippi every one contains more, than one-tenth of continental United States. From the preceding table it appears that the divisions between the Mississippi river and the Atlantic ocean have 854,903 square miles of land surface, and the divisions between the Mississippi river and the Pacific ocean have 2,115,327 square miles of land surface. The former is nearly three-tenths (28.8 per cent) and the latter is seven-tenths (71.2 per cent) of continental United States.

GEOGRAPHIC DIVISIONS BY COUNTIES.

Continental United States is divided by geographers into regions each having somewhat uniform physiographic features. In some cases the dividing lines are clear and well recognized, and in places have industrial importance. A good illustration is the "Fall line" between the Piedmont region and the Coastal plain. At the intersections of this line with rivers, rapids or falls commonly occur, and many such points have become centers of population. This line probably exerted an influence upon the location of Philadelphia, Baltimore, Washington, Richmond, Augusta, and other cities. Usually, however, the several physiographic divisions pass one into another by insensible gradations, making it impossible to fix accurately the dividing line. A number of different criteria must be applied, and their results are more or less diverse. The location of the line depends upon the balance of these results and there can be no complete agreement regarding the weight to be



assigned the several tests in the final decision. For these reasons geographers are not agreed regarding the number or the boundaries of the divisions. Under the circumstances any list must be somewhat arbitrary and tentative. Still, geographic differences exert a profound and continuous influence upon the people subject to them, and even in their present ill-defined condition furnish what is probably the best basis for a natural classification of the population of continental United States. The oldest and shortest list is that long ago adopted by the Census Office Appalachian mountain or Atlantic, Mississippi valley or Central, and Rocky mountain or Western (page 9). But each of these three divisions includes areas so diverse that they should not be grouped together.

In order that physiographic divisions may subserve statistical purposes, the lines between them must coincide with the boundaries of areas for which statistics are given separately by the Census. The smallest available area is the county. Accordingly the geographer of the Twelfth Census, Mr. Henry Gannett, has sketched 19 *physiographic divisions* of continental United States, and adjusted their boundaries to coincide with county lines. In making the division it was found desirable to consider geology, topography, altitude, rainfall, and temperature, and in many cases a result could be reached only by a compromise between opposing considerations, or where the indications were negative or indecisive, by an arbitrary determination.

The 19 physiographic divisions finally adopted were as follows:

1. New England hills.
2. Coast lowlands.
3. Coastal plain (east of the Mississippi river).
4. Piedmont region.
5. Appalachian valley.
6. Allegheny plateau.
7. Lake region.
8. Interior timbered region.
9. Mississippi alluvial region.
10. Prairie region.
11. Ozark hills.
12. Coastal plain (west of the Mississippi river).
13. Great plains.
14. Rocky mountains.
15. Columbian mesas.
16. Great basin.
17. Plateau region.
18. Pacific valley.
19. Coast ranges.

MAP 2.—PHYSIOGRAPHIC DIVISIONS OF CONTINENTAL UNITED STATES.

The situation and boundaries of these regions are indicated on the above map, and Mr. Gannett has prepared for this report the following description of their characteristic features:

Coast lowlands.—This marshy area stretches along the Atlantic and Gulf coasts from New Jersey to the Rio Grande, with few breaks in its continuity. North of Virginia, however, it is narrow, and as the coast

counties of New Jersey, Delaware, and Maryland stretch inland for considerable distances, the greater part of their area being beyond the swamps, it has been judged best not to represent this region north of the eastern shore of Virginia. South of this limit it extends inland for varying distances, in some places being narrow, in others, as in North Carolina and Louisiana, having a breadth of a hundred miles or more. Upon the Atlantic coast the surface of the swamps, although generally level, has sufficient slope for drainage, and accordingly, as the land becomes valuable, the borders of the swamps are being drained and converted into farms. In the Carolinas a considerable area is utilized for rice plantations. In the main the Coast lowlands are well timbered, principally with cypress and juniper, among which is a luxuriant growth of cane.

Coastal plain.—This comprises a strip of land lying along the Atlantic and the Gulf between the Coast lowlands and the Piedmont region. It stretches from New York bay southwest nearly to the Mississippi river. There it turns northward to the Ohio river, partly girdling the Appalachian mountain system. Westward it is divided by the Mississippi alluvial region, but reappears on the west side of the Mississippi, in the uplands of southern Missouri and Arkansas south of the Ozark hills, and in the timbered region of eastern Texas. The Coastal plain consists of soft tertiary rocks, has a level surface with little elevation above the sea, and either has, or had before the advent of the white man, a covering of pine forests. Being cut into two parts by the Mississippi alluvial region, it has been treated in the maps and tables as two physiographic divisions.

Piedmont region.—This division extends from New York bay southwest to the western boundary of Alabama. It is bordered on the southeast by the Coastal plain, the limit between the two being set by the Fall line, where the streams, in passing off the hard granite rocks of the Piedmont region to the soft tertiary rocks of the Coastal plain, have rapids or falls, marking the limit of navigation from the sea.

The Piedmont region is underlain by metamorphic rocks, mainly granitic, and was originally covered with forests of mixed hard wood and conifers. The lower portion is comparatively level, being broken only by stream beds, but the higher portion is intersected by many ridges parallel to the Appalachian system, that is, running nearly northeast and southwest.

Appalachian valley.—The name Appalachian is often given by geographers to the entire eastern mountain system of the country, but here it is applied to a narrow region extending from the Hudson to northeastern Alabama, and lying between the Piedmont region on the southeast and the Allegheny plateau on the northwest. This region has been greatly folded, faulted, and eroded, resulting in the formation of alternate and parallel, narrow, sinuous ridges and valleys; the former consisting of sandstone and quartzite, the latter of softer and more soluble limestones. The eastern of these ridges, from Maryland southwest, is known as the Blue ridge, and other ridges have received various names. Most of this region forms a depression known as the Appalachian valley, drained in different parts by different streams: The Delaware, Susquehanna, Potomac, and James cross it flowing eastward; the New river, heading in western North Carolina, crosses it, flowing to the Ohio; and the Tennessee drains it throughout east Tennessee and southwest Virginia.

New England hills.—This region is properly part of the Appalachian mountain system, but is here distinguished on account of its difference in character. The mountains, instead of being disposed in parallel ridges, are mainly isolated, irregular groups, such as the hills of Maine, the White mountains of New Hampshire, and the Adirondacks of New York, while the Green mountains of Vermont and the Berkshire hills of Massachusetts show some signs of a regular north and south trend.

This region was invaded by the ice sheet of the Laurentian glacier, traces of which are seen to-day in glacial deposits and lake basins, the latter occurring so frequently as to make this a characteristic lacustrine region.

Allegheny plateau.—Rising from the northwestern border of the Appalachian valley is an escarpment extending more or less continuously from the Hudson river southwestward to Alabama. From its summit stretches a plateau with a general northwestern slope, everywhere deeply scored into canyons by streams, whose general direction is that of the slope. These streams have cut the plateau into very irregular ridges and gorges, making it one of the most intricate mountain regions on the globe. The entire plateau is densely forested.

Interior timbered region.—West of this plateau, comprising most of Ohio, Indiana, southern Illinois, western Kentucky, and western central Tennessee, is a region possessing few distinctive characteristics beyond the fact that it is, or was when entered by the white man, pretty generally covered with forests.

Lake region.—The country bordering the Great Lakes has been segregated under this name. It is a lacustrine region, heavily forested, mainly by conifers. Owing to the proximity of large bodies of water, this region has many of the characteristics of a coast climate, the atmosphere being moist, the winters abnormally warm, and the summers abnormally cool.

Prairie region.—This is a region of transition from the forested country on the east to the barren plains on the west. On the east it merges by insensible degrees into the forest-clad regions, and on the west by equally insensible degrees into the Great plains. As its rainfall is rather light, ranging between 20 and 30 inches a year, most species of trees can not thrive. Its surface is level or slightly undulating, and in its natural state is covered with luxuriant grasses. The natural growth

of timber is sparse, and confined almost entirely to the bluffs and borders of streams, but with the protection afforded by man the growth of forests has increased, and now the region presents a landscape diversified by a tree growth the extent of which is constantly widening.

Mississippi alluvial region. –This region lies mainly below the high-water mark of the rivers traversing it. They have built up along their courses low, flat ridges which serve to protect the lower country except in times of extraordinary floods. Prior to the additional protection afforded by the system of levees the only parts not exposed to disastrous floods were these river ridges, but as the levees have extended of recent years they have made most of the region habitable and led to its being brought rapidly under tillage, and to the building of railroads. This region is well cultivated, in Louisiana mainly with sugar, and higher up on the rivers almost exclusively with cotton, which is here produced in great abundance and with an unusually long fiber, giving it a greater value than the cotton of the uplands. The soil is extremely fertile.

Ozark hills. –The southern part of this region, the portion in central Arkansas and Indian Territory, is composed of crooked, winding, octopus-like ridges of quartzite, separated by limestone valleys. The northern portion, in northern Arkansas and southern Missouri, is a plateau sloping gently northward and deeply scored by stream canyons.

Great plains.—Merging insensibly with the Prairie region are the Great plains. The line of demarcation between them, although not capable of sharp distinction, has been set at the line of normal annual rainfall of 20 inches. These plains or plateaus extend westward to the foot of the Rocky mountains, and from the Canadian to the Mexican border. They are without forests, and are sparsely covered with various species of bunch grass, changing in the more arid portions to sagebrush, cactus, and yucca. The surface is a monotonous billowy expanse, broken here and there by buttes and lines of cliffs.

Throughout this region the rainfall is insufficient for agriculture, and irrigation is necessary. The water in the streams can irrigate only a small part of the land. The plains are now occupied mainly by cattle and sheep.

Cordilleran region.—The Great plains form the long eastern slope of a plateau, the summit of which extends to the Cascade range and the Sierra Nevada. It bears upon its slopes and summit a vast number of mountain ranges, great plateaus, and elevated valleys. At the head of the slope the elevation ranges from 2,000 feet above the sea level up to 8,000 feet or more. Except in the western part of Oregon and Washington the climate is arid, and irrigation is, as a rule, necessary for the production of crops. The rainfall is least in the southwest, particularly in southern Nevada and southeast California, where it is almost entirely wanting. Forests are found, as a rule, only upon mountain ranges and the highest of the plateaus, the plains being treeless. This region has been subdivided into several areas.

Rocky mountains.—This region includes the easternmost of the mountain systems in the Cordillera. It is composed of a series of ranges separated by valleys of differing breadth, trending parallel to one another, a little west of north and east of south. It is naturally subdivided into two parts, the northern, including Montana, Idaho, and northern Wyoming, being separated from the southern by a broad belt of plateaus 100 miles or more in width. The northern part ranges in altitude from 9,000 to 13,000 feet or more, rising from a base of 4,000 or 5,000 feet. In the southern part the base is much higher, rising in Colorado to 6,000 or 8,000 feet, while many of the ranges exceed 14,000 feet in altitude. Both the general level of the country and the mountain ranges diminish in altitude in New Mexico and Texas.

Plateau region.—This region comprises most of the drainage basin of the Colorado river. It consists of great plateaus, whose surfaces are level or slightly inclined, and which terminate in great lines of cliffs, in some cases thousands of feet in height. From the mountains which border this area on the east and west, the plateaus descend by a succession of gigantic steps, from an elevation of 12,000 feet down to near sea level. Every stream is in a canyon, and as the rainfall is light and spasmodic, most of these canyons are dry during the greater part of the year. In some regions these canyons are so numerous as to have shredded the plateau to a mere skeleton, or the process of erosion may have gone even further, so that the only remains of the plateau consist of buttes and mesas. The higher plateaus, having ample rainfall, are green and forested, while the lower plateaus are covered with sparse vegetation or are absolutely sterile.

Great basin. In the interior of the Cordilleran region is a large area which has no drainage to the sea. The only outlet for its waters is by sinking into the thirsty soil or by evaporation into the atmosphere. With the exception of the country along the lower Colorado and Gila rivers, this is the most desert part of the United States. The rainfall is scanty, even upon the mountains; so scanty, indeed, that very few flowing streams originate within it. The surface is diversified by mountain ranges trending nearly north and south, separated by level valleys, floored with alluvium washed down from the mountains and deposited by the sinking of the streams. These ranges divide the basin into numerous minor basins, in each of which water collects and sinks. In the eastern part the largest of these basins is that occupied by Great Salt Lake, into which flow several small streams from the Wasatch range. In the western part the principal basin is that of the Humboldt and Truckee rivers. The elevation of the floor of the basin ranges from 6,000 feet, near its

middle line, to 200 feet below sea level in Death Valley, in the western part.

Columbian mesas.—The area drained by Snake river, and most of that drained by the Columbia above its passage through the Cascade range, has been in great part covered by eruptions of basalt, which, bursting through the overlying rock, spread over the country, forming for many thousands of square miles great table-lands.

Pacific valley.—Lying parallel to the Pacific coast, a short distance inland, is a great depression extending from British Columbia southward into southern California. This depression is occupied in part by various streams and other bodies of water, Puget sound in the north, Willamette river and other streams of Oregon, and in California by the Sacramento and its branch, the San Joaquin. The east boundary of this region is drawn upon the crest of the Cascade range and the Sierra Nevada, partly because it is necessary in order to avoid dividing counties, and partly because the amount of settlement within the mountains is not sufficiently great to warrant the separation of these ranges as a distinct physiographic feature.

Coast ranges.—Separating this valley from the Pacific is a succession of ranges trending parallel with the coast. In Oregon, Washington, and northern California they are heavily timbered, but in southern California they are almost devoid of forests. The valleys among these ranges, especially in southern California, possess the highest degree of fertility, and produce a great variety of fruits, many of which are tropical in character.

Area of physiographic divisions. The following table shows the area of each of the foregoing physiographic divisions:

TABLE XI.—*Area of physiographic divisions: 1900.*

DIVISION.	Land surface in square miles.	Per cent of total.
Continental United States	2,970,230	100.0
New England hills	82,696	2.8
Coast lowlands	82,807	2.8
Coastal plain (east of the Mississippi river)	167,097	5.6
Piedmont region	89,920	3.0
Appalachian valley	54,519	1.8
Allegheny plateau	99,539	3.4
Lake region	173,302	5.8
Interior timbered region	118,326	4.0
Mississippi alluvial region	41,713	1.4
Prairie region	454,991	15.3
Ozark hills	62,195	2.1
Coastal plain (west of the Mississippi river)	87,726	3.0
Great plains	460,994	15.5
Rocky mountains	296,220	10.0
Columbian mesas	112,525	3.8
Great basin	229,869	7.7
Plateau region	188,422	6.3
Pacific valley	106,549	3.6
Coast ranges	60,820	2.1

The Great plains is the most extensive physiographic division, followed closely by the Prairie region, the two together including nearly one-third (30.8 per cent) of continental United States. There are 5 other divisions each embracing over 5 per cent of the entire area of continental United States, and these 7 together include two-thirds (66.2 per cent) of it, leaving one-third for the remaining 12 divisions. The eastern boundary of the Great plains about bisects the country, 1,455,399 square miles, or 49.0 per cent of the area of continental United States, lying in the 7 physiographic divisions west of that north and south line, and 1,514,831 square miles, or 51.0 per cent, lying in the 12 east of it.

The following table shows the number of counties and the average area of a county in each physiographic division. The divisions are arranged in the order of increasing size of counties.

TABLE XII.—*Number and average area of counties in physiographic divisions: 1900.*

DIVISION.	Number of counties.	Average area in square miles.
Continental United States	2,828	1,050
Interior timbered region	293	404
Appalachian valley	129	423
Piedmont region	189	476
Allegheny plateau	181	550
Coastal plain (east of the Mississippi river)	278	601
Mississippi alluvial region	60	695
Prairie region	614	741
Lake region	223	777
Coastal plain (west of the Mississippi river)	110	798
Coast lowlands	99	836
New England hills	91	909
Ozark hills	59	1,054
Pacific valley	57	1,869
Coast ranges	31	1,962
Great plains	227	2,031
Columbian mesas	37	3,041
Rocky mountains	73	4,058
Great basin	45	5,108
Plateau region	32	5,888

The 7 physiographic divisions west of the eastern boundary of the Great plains have counties much above the average in area. Of the 12 physiographic divisions east of that line all but the Ozark hills have counties below average size. Treating the halves of continental United States as units, the average area of a county in what may fairly be called the upland half is 2,899 square miles; in the eastern or lowland half it is 651 square miles.

It will be seen that the smallest average size of a county is found in the Interior timbered region, including most of Ohio, Indiana, and Kentucky. Next to these are the three upland regions between the Interior timbered belt and the Atlantic Coastal plain. The largest average size of a county east of the Mississippi is found in the New England hills, a region where this unit has little historical or political importance. The size of a county in the Pacific valley and the Coast ranges is smaller than it is in the Great plains, or in any of the four regions lying between the plains and the Pacific valley.

It has already been shown that the Central and Western states are larger than the Eastern. This table shows that the same is in some degree, but not so uniformly, true of the counties.

POPULATION.

SUMMARY OF RESULTS.

The total population of the United States about 1900 was 84,907,156.

This sum is reached by adding to the population enumerated by the Twelfth Census the results of the censuses of Porto Rico in 1899 and of the Philippine Islands in 1903 and estimates for Guam and Samoa.

Only three countries, the Chinese Empire, the British Empire, and the Russian Empire, have unquestionably a greater population than the United States. France, with its various possessions, has only about the same population as this country.

The North, as defined by the Census, has about the same area as the South and almost twice the population.

The average population of a state or territory in the Atlantic and Central divisions (1,843,672) is about five times the average population of a state or territory in the Western division (371,941).

Fifteen-sixteenths of the population of continental United States is east of a line which almost bisects the area, namely, the eastern boundary of the Great plains.

The most usual or the typical population of a county is from 16,000 to 18,000—these figures differing widely from those of the average population (26,646).

The population of places called cities ranges from New York city with 3,437,202 to Rainy Lake city with 7. The arbitrary definition of cities, adopted by the Census Office, is all incorporated places having at least 2,500 inhabitants and also all unincorporated New England towns of like size and not containing an incorporated place.

In continental United States two-fifths of the population live in cities and three-fifths in the country. In the North Atlantic division the former class is more than two-thirds of the total population, in the North Central and Western divisions more than one-third, and in the South more than one-sixth.

DISCUSSION OF POPULATION.

Definition.—Population means the number of living persons. But that number is constantly being increased by births and decreased by deaths. To exclude these variations and make the word serviceable for census purposes, the definition must include reference to a certain date, which is called the census day. Population, as a census term, means the number of persons living on the census day. At the Twelfth Census of the United States each enumerator was instructed to obtain the required information "as of date June first," 1900; births and deaths occurring between June 1 and the time of the enumerator's visit were to be disregarded, and a return made of the persons living on that day, and of no others.[1] Some countries specify not merely the day but also the moment for which the census speaks,[2] a refinement which in view of the imperfections inseparable from all census work is of theoretical rather than of practical value.

If population means the number of persons living, the population of a country must mean the number of persons living in a country. "Living in" is naturally understood as residing in or inhabiting, and that is the meaning given the phrase by Congress and the Census Office. The population of the United States, therefore, means the number of persons whose usual place of abode, on the census day, is within the United States.

If any such persons are absent from the country when the census is taken, they are included. If persons whose usual place of abode is elsewhere are present in the country when the census is taken, they are excluded. The same is true of each enumeration district. The persons to be reported from it are not the persons found in it by the enumerator, but the persons whose usual place of abode is within it, whether they are in fact present or absent.

The Census Office does not define the phrase of the law, "usual place of abode."[3] In some cases it is difficult for the conscientious enumerator to decide where a person has his usual place of abode. A similar question is often a puzzle even to the courts, turning mainly upon a careful balance of probabilities regarding intent. Such considerations have led to an alternative definition of population for census purposes, as the people present in a country or a district on the census day, no matter where the usual place of abode may be.

[1] 30 Stat. L., 1018. Twelfth Census, Instructions to Enumerators, secs. 94, 109, and 110.

[2] For example, the instructions issued in connection with the Canadian census of 1901 state: "The decisive hour of reckoning is made 12 o'clock or midnight on the night of 31st March to 1st April, so that every one born before that hour and every one dying after it are to be counted in the population."

[3] Twelfth Census, Instructions to Enumerators, secs. 111–119.

In the census usage of the world, therefore, the word population has two main meanings—the number of persons present in a country at a fixed moment or day, and the number of persons resident in a country at a fixed moment or day. The former is called the *de facto* population, the latter the *de jure* population. In the census practice of the United States and Canada, population means *de jure* population; in the practice of most other countries it means *de facto* population.

Area of enumeration.—The population of the area of enumeration, June 1, 1900, according to the Twelfth Census was 76,303,387.[1] A careful census is like a decision by a court of last resort—there is no higher or equal authority to which to appeal.[2] Hence there is no trustworthy means of determining the degree of error to which a census count of population is exposed, or the accuracy with which any particular census is taken. But no well-informed person believes that the figures of a census, however carefully taken, may be relied upon as accurate to the last figures. There being no test available, the opinions of competent experts may be put in evidence in support of this conclusion. Thus Francis A. Walker, Superintendent of the Ninth and Tenth censuses, testified in 1892 to a select committee of the House: "I should consider that a man who did not come within half of 1 per cent of the population had made a great mistake and a culpable mistake."[3] Hon. Carroll D. Wright, Commissioner of Labor, who completed the work of the Eleventh Census, wrote in July, 1897: "I think that the Eleventh Census came within less than 1 per cent of the true enumeration of the inhabitants," and authorized the publication of this opinion.

In the light of these expressions of opinion, and in view of the serious difficulties in the way of accurately determining the population of the United States, I doubt that one is warranted in assuming that the population was determined by the Twelfth Census with greater accuracy than the area of continental United States. It has been shown (page 4) that two independent measurements of the land surface of continental United States differ by about one-tenth of 1 per cent. If we assume that the population figure misses the goal of perfect accuracy by at least the same amount, or that the minimum probable error was one-tenth of 1 per cent, then the true population of the area of enumeration, June 1, 1900, lay between 76,227,000 and 76,380,000. If the round number 76,300,000 be taken to express everything between 76,250,000 and 76,350,000, then perhaps that number may be deemed trustworthy, the probable error being well within the limits required for any scientific use likely to be made of the results.

United States.—In the discussion of area (page 3) it was shown that the United States includes some territory not embraced in the area of enumeration. To get an approximation to the total population, figures for the territory outside the area of enumeration—those for Guam and Samoa being subject to a large probable error—have been added to the population reported by the Twelfth Census. The result is stated in the following table:

TABLE I.—*Population of the United States about 1900.*

DIVISION.	Date of census or estimate.	Population.
United States		84,907,156
Area of enumeration	1900	76,303,387
Philippine Islands[1]	1903	7,635,426
Porto Rico[2]	1899	953,243
Guam[3]	1900	[4] 9,000
Samoa	1901	[4] 6,100

[1] Census of the Philippine Islands, 1903, Vol. II, page 15.
[2] War Department, Census of Porto Rico, 1899, page 40.
[3] War Department, Adjutant-General's Office, No. XXVIII, Report on the island of Guam, page 20.
[4] Estimate.

The estimate for American Samoa was reported to the Census Office by the Navy Department in the following letter, which the Census Office has been authorized to print:

NAVY DEPARTMENT,
Washington, D. C., June 4, 1901.

To the DIRECTOR OF THE CENSUS.

SIR: The Department is in receipt of a letter from the Commandant of the United States Naval Station, Tutuila, Samoan Islands, in which he reports the population of the islands under the jurisdiction of the Navy Department as follows: Tutuila, 4,000; Manua group, 2,000; total, 6,000. The above figures represent the census taken during the past year, and include the adults and children (native Samoans). In addition to the native population, there are approximately 100 whites.

Very respectfully,

(Signed) F. W. HACKETT,
Acting Secretary.

With these figures for the United States may be compared Table II, compiled from the most recent English and German sources. The differences between the two authorities furnish some indication of the margin of error to which the figures are subject. The table includes all countries to which either authority assigns a population of at least 25,000,000. The names of the countries are to be taken in a legal sense, as sovereign powers, rather than in a geographical sense—France, the German Empire, and the Netherlands, for example, like the British Empire, including populous territory in other parts of the world than Europe.

[1] Twelfth Census, Vol. I, page 2.
[2] Appendix, Methods of Estimating Population.
[3] House Report No. 2393, page 73, Fifty-second Congress, second session.

TABLE II.—*Population of each country having at least 25,000,000 inhabitants.*

COUNTRY.	POPULATION ACCORDING TO— Statesman's Yearbook, 1904.	Hübner's Tabellen, 1904.
Chinese Empire	426,047,325	330,130,000
British Empire	394,436,111	398,730,145
Russian Empire	129,004,520	130,911,254
France	92,374,285	89,318,528
German Empire	69,875,178	70,003,124
Austria-Hungary	45,405,267	48,141,961
Japan	44,805,937	48,351,723
Netherlands	41,104,137	43,215,569
Ottoman Empire	39,787,640	49,792,825
Italy	32,475,253	32,961,247
Total	1,315,315,653	1,241,556,376

These ten countries, with the United States, include, according to the best authorities, at least five-sixths of the total population of the earth.

Main geographic divisions.—The following table gives the population of the main geographic divisions of continental United States, and the per cent each makes of the whole population:

TABLE III.—*Population of main geographic divisions: 1900.*

DIVISION.	Population.	Per cent of total.
Continental United States	75,994,575	100.0
North Atlantic	21,046,695	27.7
South Atlantic	10,443,480	13.7
North Central	26,333,004	34.7
South Central	14,080,047	18.5
Western	4,091,349	5.4

To these figures for continental United States there must be added for Alaska 63,592, for Hawaii 154,001, for the other outlying districts the figures given in Table I, and for the persons in the military and naval service outside of continental United States 91,219, in order to reach the total already stated for the entire United States, namely, 84,907,156.

From the preceding table it appears that the most populous divisions are the North Central and the North Atlantic, the former containing one-third and the latter over one-fourth of the entire population. Each northern division contains about twice as many inhabitants as the corresponding southern division, the entire population of the Northern states being 47,379,699, and of the Southern states, 24,523,527. The North, while exceeding the South in area by only 4.2 per cent (page 10) exceeds it in population by 93.2 per cent. The Atlantic divisions have 41.4 per cent, the Central divisions 53.2 per cent, and the Western division 5.4 per cent of the population.

Minor geographic divisions.—The following table gives the population of the 11 minor geographic divisions into which the 5 main divisions have been broken:

TABLE IV.—*Population of minor geographic divisions: 1900.*

DIVISION.	Population.	Per cent of total.
Continental United States	75,994,575	100.0
New England	5,592,017	7.4
Southern North Atlantic	15,454,678	20.3
Northern South Atlantic	4,464,481	5.9
Southern South Atlantic	5,978,999	7.8
Eastern North Central	15,985,581	21.1
Western North Central	10,347,423	13.6
Eastern South Central	7,547,757	9.9
Western South Central	6,532,290	8.6
Rocky Mountain	1,232,642	1.6
Basin and Plateau	442,015	0.6
Pacific	2,416,692	3.2

The preceding table shows that the most populous divisions are the Eastern North Central, the Southern North Atlantic, and the Western North Central, which together include more than one-half (55.0 per cent) of the population of continental United States, although they include little more than one-fourth (28.8 per cent) of the area (Table x, page 10). The country east of the Mississippi has nearly three-fourths (72.4 per cent), that west of the Mississippi rather more than one-fourth (27.6 per cent), of the population of continental United States.

States and territories.—In the following table the states and territories are arranged in order of population, and the number of inhabitants in each is given:

TABLE V.—*Population of states and territories arranged in order of population: 1900.*

STATE OR TERRITORY.	Population.	Per cent of total.
United States	84,907,156	100.0
Philippine Islands	7,635,426	9.0
New York	7,268,894	8.6
Pennsylvania	6,302,115	7.4
Illinois	4,821,550	5.7
Ohio	4,157,545	4.9
Missouri	3,106,665	3.7
Texas	3,048,710	3.6
Massachusetts	2,805,346	3.3
Indiana	2,516,462	3.0
Michigan	2,420,982	2.9
Iowa	2,231,853	2.6
Georgia	2,216,331	2.6
Kentucky	2,147,174	2.5
Wisconsin	2,069,042	2.4
Tennessee	2,020,616	2.4
North Carolina	1,893,810	2.2
New Jersey	1,883,669	2.2
Virginia	1,854,184	2.2
Alabama	1,828,697	2.2
Minnesota	1,751,394	2.1
Mississippi	1,551,270	1.8
California	1,485,053	1.7
Kansas	1,470,495	1.7
Louisiana	1,381,625	1.6
South Carolina	1,340,316	1.6
Arkansas	1,311,564	1.5
Maryland	1,188,044	1.4
Nebraska	1,066,300	1.3
West Virginia	958,800	1.1
Porto Rico	953,243	1.1
Connecticut	908,420	1.1
Maine	694,466	0.8
Colorado	539,700	0.6
Florida	528,542	0.6
Washington	518,103	0.6

TABLE V.—*Population of states and territories arranged in order of population: 1900*—Continued.

STATE OR TERRITORY.	Population.	Per cent of total.
Rhode Island	428,556	0.5
Oregon	413,536	0.5
New Hampshire	411,588	0.5
South Dakota	401,570	0.5
Oklahoma	398,331	0.5
Indian Territory	392,060	0.5
Vermont	343,641	0.4
North Dakota	319,146	0.4
District of Columbia	278,718	0.3
Utah	276,749	0.3
Montana	243,329	0.3

Delaware	184,735	0.2
Idaho	161,772	0.2
Hawaii	154,001	0.2
Arizona	122,931	0.1
Wyoming	92,531	0.1
Alaska	63,592	0.1
Nevada	42,335	0.1
Guam	9,000	(1)
Samoa	6,100	(1)
Not specified [2]	91,219	0.1

[1] Less than one-tenth of 1 per cent.
[2] Persons in the military and naval service outside continental United States.

The inhabitants of the Philippine Islands are more numerous than those of New York, and those of Porto Rico almost as numerous as those of West Virginia. Each of the other outlying districts has a comparatively small population. The 8 leading states extend across the country from Massachusetts to Texas, with only one break, the large area of the Western states, already noted, compensating in some degree for their smaller population per unit of area. If Michigan and Iowa be included with these 8 states, the group of 10 contains more than half the inhabitants of continental United States.

Of the 39 states and territories in the Atlantic and Central divisions two-thirds (26) have each more than 1,000,000 inhabitants; of the 11 states and territories in the Western division only 1 has more than 1,000,000 inhabitants. The average population of the 18 states on the Atlantic coast, including the District of Columbia, is 1,749,454; of the 21 states and territories in the Central divisions, 1,924,431; of the 11 states and territories in the Western division, 371,941. In the Western division, in other words, the mean population of a state or territory is about one-fifth of what it is in the Mississippi valley or on the Atlantic coast. The greater area of the Western states and territories does not at present offset their much smaller population per unit of area.

By dividing the population of each minor division (Table IV) by the number of states and territories therein (Table V) the following results are reached:

TABLE VI.—*Average population of a state or territory in each minor geographic division: 1900.*

DIVISION.	Average population of a state or territory.
New England	932,003
Southern North Atlantic	5,151,559
Northern South Atlantic	892,896
Southern South Atlantic	1,494,750
Eastern North Central	3,197,116
Western North Central	1,478,203
Eastern South Central	1,886,939
Western South Central	1,306,458
Rocky Mountain	246,528
Basin and Plateau	147,338
Pacific	805,564

The preceding table shows that the states in the Southern North Atlantic and Eastern North Central groups have by far the greatest average population. In those two regions the average population of the eight states is nearly four million (3,930,032). In each of the eight Atlantic and Central divisions and in the Pacific division the average is above 800,000. The average population of a state or territory in the Rocky Mountain or Basin and Plateau divisions is notably less than in the Pacific division. From Table V, page 6, it will be seen that in average area there is no such difference between them. It must be due, therefore, to the greater proportion of well-settled area in the Pacific coast states.

Physiographic divisions.—Table VII shows the population of each of the 19 physiographic divisions described on pages 11 to 14 and sketched on page 11. The per cent of the total population of continental United States residing in each division is given, and the introduction of the last column from Table XI, page 14, permits a rough comparison to be made between the population and area of each. The divisions are arranged in order of population.

TABLE VII.—*Distribution of population and area of continental United States by physiographic divisions: 1900.*

DIVISION.	Population.	PER CENT OF TOTAL.	
		Population.	Area.
Continental United States	75,994,575	100.0	100.0
Prairie region	13,300,970	17.5	15.3
New England hills	10,260,153	13.5	2.8
Lake region	9,571,215	12.6	5.8
Interior timbered region	8,129,760	10.7	4.0
Piedmont region	6,809,103	9.0	3.0
Coastal plain (east of the Mississippi river)	6,427,635	8.4	5.6
Allegheny plateau	6,070,246	8.0	3.4
Appalachian valley	4,499,072	5.9	1.8
Coastal plain (west of the Mississippi river)	1,974,677	2.6	3.0
Coast lowlands	1,865,952	2.4	2.8
Mississippi alluvial region	1,227,094	1.6	1.4
Ozark hills	1,203,880	1.6	2.1
Coast ranges	1,079,992	1.4	2.1
Great plains	1,052,719	1.4	15.5
Pacific valley	995,363	1.3	3.6
Rocky mountains	592,972	0.8	10.0
Great basin	375,345	0.5	7.7
Columbian mesas	356,758	0.5	3.8
Plateau region	201,669	0.3	6.3

The preceding table shows that the Prairie region and the New England hills include over three-tenths (31.0 per cent), and with the Lake region and the Interior timbered region over one-half (54.3 per cent) of the population of the country. The table, when carefully examined, also shows that each of the 12 physiographic divisions east of the eastern boundary of the Great plains except the Ozark hills, the Coast lowlands, and the western part of the Coastal plain, has a larger proportion of the population than it has of the area of the country, while in each of the 7 physiographic divisions west of that line, the reverse is true. It has already been shown that this line almost exactly bisects the country; from this table it is clear that it separates the relatively well settled from the sparsely settled parts. East of this line lies 51.0 per cent of the area, with 93.9 per cent of the population; west of it lies 49.0 per cent of the area, with 6.1 per cent of the population.

Counties.—There are 2,852 counties or equivalent divisions in continental United States, from each of which some population was returned. The population of these divisions was 75,994,575. The average population of a county was, therefore, 26,646. But as these 2,852 counties vary in population from 4 in Bailey county, Tex., to 2,050,600 for New York county, N. Y., the average of a series within which the range is so wide has little importance. To show what is the most usual population of a county in continental United States and the 5 divisions, the following table has been prepared:

TABLE VIII. *Counties grouped according to population, for continental United States and for main geographic divisions: 1900.*

LIMITS OF POPULATION.	NUMBER OF COUNTIES WITHIN SPECIFIED LIMITS OF POPULATION IN—					
	Continental United States.	North Atlantic division.	South Atlantic division.	North Central division.	South Central division.	Western division.
Total	2,852	216	520	1,029	772	315
Less than 5,000	394	4	28	115	124	123
5,000 to 10,000	425	4	107	131	106	77
10,000 to 15,000	455	6	103	151	148	47
15,000 to 20,000	484	14	105	193	141	31
20,000 to 25,000	317	12	63	137	95	10
25,000 to 30,000	226	14	46	99	59	8
30,000 to 35,000	153	23	27	65	35	3
35,000 to 40,000	73	11	11	26	21	4
40,000 to 45,000	54	13	4	26	11	.....
45,000 to 50,000	46	14	5	20	5	2
50,000 and over	225	101	21	66	27	10

The most usual population of a county in continental United States is between 15,000 and 20,000, but this statement holds for only one of the five geographic divisions, the North Central. In the Western division the counties of less than 5,000 inhabitants are most numerous, and the number in each class decreases regularly therefrom. In the South Atlantic division the counties of 5,000 to 10,000 inhabitants are in excess, but the numbers in the two following classes, 10,000 to 15,000 and 15,000 to 20,000, are almost as great. In the South Central division the largest class is that of counties of 10,000 to 15,000 inhabitants. In the North Atlantic division among classes having a range of 5,000 the largest is that of counties with a population of 30,000 to 35,000. But the class of counties with 50,000 inhabitants and over is quadruple any other class, witnessing primarily to the great number of cities in that division, and also to the great area of the counties, which average fully one-third larger than those in the Eastern North Central group.

The preceding table shows that when the counties of continental United States are grouped by population, the largest class is that with 15,000 to 20,000 inhabitants, about one county in six falling within that group. To ascertain more accurately what is the prevailing population of a county in the United States as a whole, the number falling in groups with a range of only 1,000 has been found. Without giving this table in full, the following figures show more exactly what population of a county occurs most commonly in the United States:

LIMITS OF POPULATION.	Number of counties.
15,000 to 16,000	97
16,000 to 17,000	109
17,000 to 18,000	109
18,000 to 19,000	85
19,000 to 20,000	84

These figures show that the most usual population of a county in continental United States is from 16,000 to 18,000, about one-thirteenth of the counties in the country falling within these limits.

City and country.—The population of the United States is classified by the Census Office not only by states and territories, counties, and minor civil divisions, but also into the groups of urban and rural. In both classifications the boundary lines of the areas by which the population is returned must be carefully ascertained and rigidly followed or irreparable confusion and error result. In classifying people as urban and rural it is necessary also to define carefully the line between these classes. The meaning popularly attached to urban, namely, pertaining to a city, has been found inapplicable to census purposes, owing to the different meanings of "city" in the different parts of the United States. The dictionary definition, "an incorporated municipality," might be thought adequate. But this country contains New York city with 3,437,202 inhabitants and Rainy Lake city with 7 inhabitants. There are 10,601 incorporated places in continental United States, of which 4,318 have less than 500 inhabitants, 8,949 have less than 2,500, and 9,553, or over nine-tenths of the entire number, less than 4,000.[1] The treatment accorded small incorporated places varies somewhat with the object in view and somewhat with individual judgment. No one classifies them as urban. In the first volume of the Twelfth Census (page lxxxix) all incorporated places having less than 4,000 inhabitants have been assigned to an intermediate class as semiurban. For the purposes of the present analysis all having less than 2,500 inhabitants have been classed with the rural population, and all with more than 2,500 with the urban.

What is perhaps a more serious difficulty arises in the proper classification of populous but unincorporated New England towns, some of which possess well-defined urban characteristics. In this difficulty the general rule of the population division[2] has been followed, and all New England towns which have a population of 2,500 or more and do not contain an incorporated place have been classed as urban. Accordingly, the definition of city population here adopted is, the population living in incorporated places having at least 2,500 inhabitants, and, in addition, the population of New England towns of like size and not containing an incorporated place. The population of country districts includes all persons not living in cities as just defined.

[1] Twelfth Census, Vol. I, Table XVI, page lviii; Table XVII, page lx; and Table 8, pages 438–480.
[2] Twelfth Census, Vol. I, page lxxxi.

TABLE IX.—POPULATION AND PER CENT OF POPULATION IN CITIES HAVING AT LEAST 2,500 INHABITANTS AND IN COUNTRY DISTRICTS, FOR MAIN AND MINOR GEOGRAPHIC DIVISIONS: 1900.

DIVISION.	POPULATION.			PER CENT OF POPULATION—	
	Total.	Of cities.	Of country districts.	In cities.	In country districts.
Continental United States	75,994,575	30,583,411	45,411,164	40.2	59.8
North Atlantic division	21,046,695	14,352,647	6,694,048	68.2	31.8
New England	5,592,017	4,276,764	1,315,253	76.5	23.5
Southern North Atlantic	15,454,678	10,075,883	5,378,795	65.2	34.8
South Atlantic division	10,443,480	2,232,632	8,210,848	21.4	78.6
Northern South Atlantic	4,464,481	1,421,173	3,043,308	31.8	68.2
Southern South Atlantic	5,978,999	811,459	5,167,540	13.6	86.4
North Central division	26,333,004	10,148,927	16,184,077	38.5	61.5
Eastern North Central	15,985,581	7,202,383	8,783,198	45.1	54.9
Western North Central	10,347,423	2,946,544	7,400,879	28.5	71.5
South Central division	14,080,047	2,188,253	11,891,794	15.5	84.5
Eastern South Central	7,547,757	1,131,056	6,416,701	15.0	85.0
Western South Central	6,532,290	1,057,197	5,475,093	16.2	83.8
Western division	4,091,349	1,660,952	2,430,397	40.6	59.4
Rocky Mountain	1,232,642	406,179	826,163	33.0	67.0
Basin and Plateau	442,015	132,117	309,898	29.9	70.1
Pacific	2,416,692	1,122,356	1,294,336	46.4	53.6

The preceding table shows that in continental United States two-fifths of the population live in cities and three-fifths in the country. The main geographic divisions fall roughly into three classes—the North Atlantic, with more than two-thirds of its population in cities; the North Central and Western, with more than one-third (38.8 per cent); and the two southern divisions, with more than one-sixth (18.0 per cent). When the 11 minor groups are considered, it appears that next to the two divisions of the North Atlantic group, with more than three-fifths of their population in cities, comes the Pacific group, with a per cent of population in cities slightly higher than that for the Eastern North Central (45.1). The Northern South Atlantic, Western North Central, Rocky Mountain, and Basin and Plateau groups all have about three-tenths of their population in cities, while the two South Central groups and the Southern South Atlantic have in the vicinity of one-seventh.

In the following table the number and per cent of population in cities and in country districts is given for every state and territory of continental United States. The divisions are arranged in order of decreasing per cent of urban population, from the District of Columbia to Indian Territory.

TABLE X.—*Population and per cent of population in cities having at least 2,500 inhabitants and in country districts, for states and territories: 1900.*

STATE OR TERRITORY.	POPULATION.			PER CENT OF POPULATION—	
	Total.	Of cities.	Of country districts.	In cities.	In country districts.
District of Columbia	278,718	278,718	.....	100.0	.....
Rhode Island	428,556	407,240	21,316	95.0	5.0
Massachusetts	2,805,346	2,567,098	238,248	91.5	8.5
Connecticut	908,420	680,478	227,942	74.9	25.1
New York	7,268,894	5,298,111	1,970,783	72.9	27.1
New Jersey	1,883,669	1,329,162	554,507	70.6	29.4
New Hampshire	411,588	226,269	185,319	55.0	45.0
Pennsylvania	6,302,115	3,448,610	2,853,505	54.7	45.3
Illinois	4,821,550	2,600,058	2,221,492	53.9	46.1
California	1,485,053	777,699	707,354	52.4	47.6
Maryland	1,188,044	591,206	596,838	49.8	50.2
Colorado	539,700	260,651	279,049	48.3	51.7
Ohio	4,157,545	1,997,100	2,160,445	48.0	52.0
Delaware	184,735	85,717	99,018	46.4	53.6
Maine	694,466	303,904	390,562	43.8	56.2
Washington	518,103	211,477	306,626	40.8	59.2
Michigan	2,420,982	952,323	1,468,659	39.3	60.7
Wisconsin	2,069,042	790,213	1,278,829	38.2	61.8
Utah	276,749	105,427	171,322	38.1	61.9
Missouri	3,106,665	1,128,104	1,978,561	36.3	63.7
Montana	243,329	84,554	158,775	34.7	65.3
Indiana	2,516,462	862,689	1,653,773	34.3	65.7
Minnesota	1,751,394	598,100	1,153,294	34.1	65.9
Oregon	413,536	133,180	280,356	32.2	67.8
Wyoming	92,531	26,657	65,874	28.8	71.2
Vermont	343,641	91,775	251,866	26.7	73.3
Louisiana	1,381,625	366,288	1,015,337	26.5	73.5
Iowa	2,231,853	572,386	1,659,467	25.6	74.4
Nebraska	1,066,300	252,702	813,598	23.7	76.3
Kansas	1,470,495	330,903	1,139,592	22.5	77.5
Kentucky	2,147,174	467,668	1,679,506	21.8	78.2
Florida	528,542	107,031	421,511	20.3	79.7
Virginia	1,854,184	340,067	1,514,117	18.3	81.7
Texas	3,048,710	520,759	2,527,951	17.1	82.9
Nevada	42,335	7,195	35,140	17.0	83.0
Tennessee	2,020,616	326,639	1,693,977	16.2	83.8
Arizona	122,931	19,495	103,436	15.9	84.1
Georgia	2,216,331	346,382	1,869,949	15.6	84.4
West Virginia	958,800	125,465	833,335	13.1	86.9
South Carolina	1,340,316	171,256	1,169,060	12.8	87.2
New Mexico	195,310	24,614	170,696	12.6	87.4
Alabama	1,828,697	216,714	1,611,983	11.9	88.1
South Dakota	401,570	40,936	360,634	10.2	89.8
North Carolina	1,893,810	186,790	1,707,020	9.9	90.1
Oklahoma	398,331	36,211	362,120	9.1	90.9
Arkansas	1,311,564	111,733	1,199,831	8.5	91.5
Mississippi	1,551,270	120,035	1,431,235	7.7	92.3
North Dakota	319,146	23,413	295,733	7.3	92.7
Idaho	161,772	10,003	151,769	6.2	93.8
Indian Territory	392,060	22,206	369,854	5.7	94.3

The main results of the foregoing table may be made clearer to the eye through a shaded map. For this purpose the scale from 0 to 100 per cent has been divided into five parts of equal range, 0 to 19, 20 to 39, 40 to 59, 60 to 79, and 80 and over, and the states and territories falling into each part have been given the same shading on an outline map. The results appear in the map on page 22.

The map shows that the states with a large city population include New York, New Jersey, and those in southern New England; that the states and territories with a small city population include, along with the Dakotas, Idaho, Nevada, and the Virginias, all except Florida and Louisiana lying south of the state boundary lines nearest the parallel of 37 and between the Atlantic ocean and California; and that the states with a medium amount of city population (20 to 59 per cent) include Florida and Louisiana, the Pacific states, and all lying mainly north of the parallel just mentioned except those in the vicinity of New York harbor, the Virginias, the Dakotas, Idaho, and Nevada. The influence of commercial facilities is suggested by the high proportion of urban population about New York harbor, in Louisiana, and in the Pacific states; but perhaps the main inference from the map is a precise and emphatic indication of the contrast between the South on the one hand and the North and West on the other. Disregarding the border states of Delaware, Maryland, and Kentucky, every Southern state but Florida and Louisiana has less than one-fifth of its population in cities. In every Northern state as far west as the Great plains more than one-fifth of the population live in cities. To find a statistical generalization holding true so uniformly of each member of the class is rather unusual.

The definition of urban population here employed differs slightly from those given by the population division and the division of vital statistics. The former makes the population limit 4,000,[1] the latter makes it 8,000.[2] But the social and economic characteristics of

[1] Twelfth Census, Vol. I, page lxxxiii.
[2] Twelfth Census Bulletin No. 83, page 2.

urban places, however defined, vary greatly according to the number of inhabitants. The differences between cities of over 100,000 people and towns of 4,000 to 8,000 people are probably almost equal to those separating the latter class from the population of country districts, and the several classes pass into each other by imperceptible gradations. In view of this fact and of the uncertainty regarding the best population limit, it seems best to divide the urban population into groups, the limits between the lower groups being so fixed as to conform to those recognized in prior publications of the present census. Accordingly, the following groups have been adopted: (1) Places having at least 100,000 inhabitants; (2) places having 25,000 to 100,000 inhabitants; (3) places having 8,000 to 25,000 inhabitants; (4) places having 4,000 to 8,000 inhabitants; (5) places having 2,500 to 4,000 inhabitants. Table XI gives for each state and territory, and for the main and minor geographic divisions of continental United States, the per cent of population living in cities of these several classes and in the country districts.

MAP 3.—PER CENT OF POPULATION IN CITIES HAVING AT LEAST 2,500 INHABITANTS, FOR STATES AND TERRITORIES: 1900.

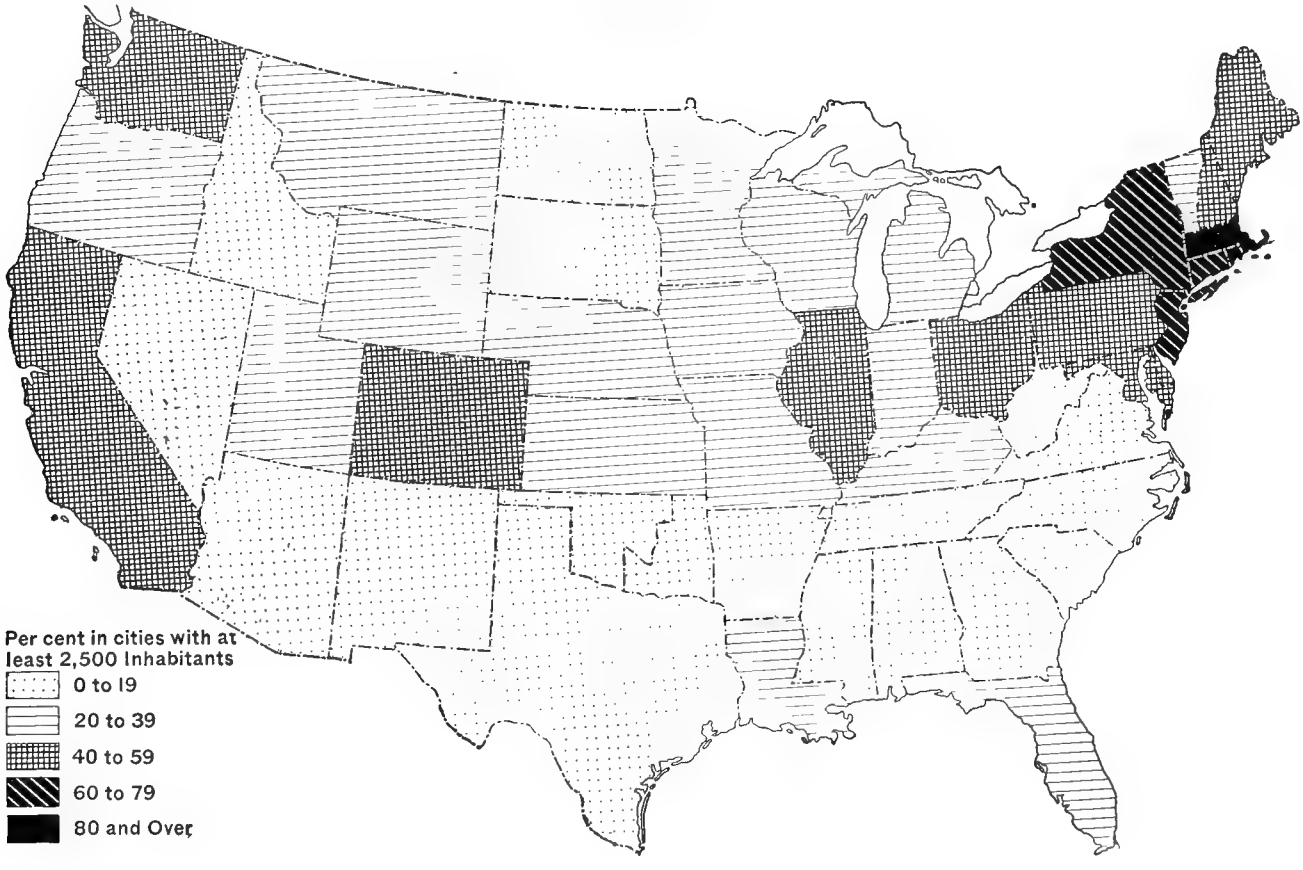

TABLE XI.—PER CENT OF POPULATION LIVING IN CITIES WITHIN SPECIFIED LIMITS OF SIZE AND IN COUNTRY DISTRICTS, FOR STATES AND TERRITORIES: 1900.[1]

STATE OR TERRITORY.	PER CENT OF POPULATION: 1900.

[1] These per cents are derived from figures given in Table XII, page 25.

The first line of Table XI shows that the population of cities of at least 100,000 inhabitants (38 in number) is about equal to that of cities of 4,000 to 100,000 inhabitants (1,119 in number), each group containing between 18 and 19 per cent of the population of continental United States. More than half the population of New York state, more than two-fifths that of Maryland and Rhode Island, and more than one-third that of Illinois live in cities of at least 100,000 inhabitants.

The second column shows that in New England, cities of 25,000 to 100,000 include over one-fifth of the whole population, a much larger proportion than in any other division. Next to New England in this particular are the Pacific, and Basin and Plateau divisions. Among the several states, Delaware has the largest proportion of its population—over four-tenths—in cities of 25,000 to 100,000; Massachusetts and Washington follow with three-tenths, and Connecticut and Oregon with over two-tenths. Georgia is the only state south of the Potomac or Ohio in which the per cent of its population living in cities of 25,000 to 100,000 is above the average for continental United States.

In New Hampshire, Rhode Island, and Wyoming, nearly one-fourth of the population live in cities of 8,000 to 25,000 inhabitants, a proportion more than three times the average of continental United States. For every state in the North Atlantic and Eastern North Central groups the proportion in cities of this class is above the average for the country. The same is true of Virginia, Florida, and 6 states west of the Mississippi.

The per cent of population living in cities of 4,000 to 8,000 is considerably smaller than in either of the preceding classes. This class of population is largest proportionately in Maine, southern New England, Arizona, and Nevada. The per cent of population living in cities of 2,500 to 4,000 inhabitants is larger in the Western division than in any other of the 5 main divisions. The leading states in this respect are Connecticut, Utah, New Hampshire, Maine, and Colorado. But in none does one-tenth of the population live in cities of this class.

In the proportion of their urban population the rank of the states varies with the population limit adopted. When it is 100,000 the states with most urban population are New York, Maryland, and Rhode Island; when it is 25,000 the leading states are New York (61.3 per cent), Massachusetts (58.3 per cent), and Rhode Island (56.7 per cent). At this limit Delaware has a larger proportion of urban population than Pennsylvania. Only when the limit is lowered to 8,000 do Rhode Island and Massachusetts rise to the leading position, the per cents then running, Rhode Island, 81.2; Massachusetts, 76.0; and New York, 68.5.

The location of the 160 cities of continental United States each having at least 25,000 inhabitants in 1900 is indicated, as accurately as the scale admits, on the following map. It shows a cluster in eastern Massachusetts—that state having 20 cities of this class—another cluster about New York harbor, many cities in the mining and manufacturing regions of Pennsylvania, 12 along the Great Lakes, 10 on the Mississippi river, 7 on the Ohio, and 7 on the Missouri.

[1] Compiled from Twelfth Census, Vol. I, Tables XXV, XXVIII, XXX, XXXII, 5, and 23.

DENSITY OF POPULATION.

SUMMARY OF RESULTS.

In the United States as a whole there is an average of 23 persons to a square mile, the density of population being about five-sixths the average of 28 for the earth.

In the outlying districts, the density of population varies widely, few parts of the earth being more uninhabited than Alaska and few more thickly settled than Porto Rico.

In continental United States the density of population is about 26 (25.6). This is somewhat less than the average for the earth as a whole and only about one-seventh that for Austria-Hungary, the most sparsely settled of the large and populous countries in Europe.

Among the states and territories, omitting the District of Columbia, the density ranges between 407 to a square mile in Rhode Island and less than 1 to a square mile in Wyoming and Nevada. The typical or most usual density of population is about 40 persons to a square mile.

The density is at least 100 in nine states extending along the Atlantic coast from the Merrimac river to the Potomac, except Delaware, and inland across Ohio. In fact, a central belt somewhat more densely settled than the region to the north or south of it may be traced from the Atlantic coast as far west as Utah.

There are 30 counties in continental United States with more than 500 persons to a square mile, the bulk of them being east of the Mississippi and north of the Ohio and Potomac rivers. The density of population is greatest in the counties comprising New York city, and next in those counties including certain other large cities —Baltimore, Boston, Philadelphia, St. Louis, Jersey City, and San Francisco.

DISCUSSION OF DENSITY.

Definition. —The United States includes, in Alaska and parts of the great West, large areas entirely without human inhabitants. It also includes in its great cities, and especially in New York, areas in which men and women live probably in as close association as anywhere on the earth's surface. For measuring the variations between these extremes the notion of density of population is employed. It means the average number of human beings living on some unit of land surface. The usual unit of surface in English-speaking countries is the square mile, but where the population is closely packed together, as in large cities, the acre is sometimes used as a unit. For special purposes, like legislation relative to factories or to tenement house districts, or to steerage accommodations, the crowding of people together is measured sometimes by a reference to volume. Examples of this are the average cubic feet of air space per capita,[1] or the number of persons to a dwelling[2] or a room.[3] But the standard method of measuring unevenness in the distribution of human beings over the earth's surface is by computing the density of population.

United States. —The average density of population in the United States as a whole is found by dividing the total population, 84,907,156, by the total area, 3,686,306 square miles. This gives a density of population of 23. Over the earth's surface there are probably on the average about 28 persons to a square mile, so that the density of population in the United States at the present time is about five-sixths the average for the earth.

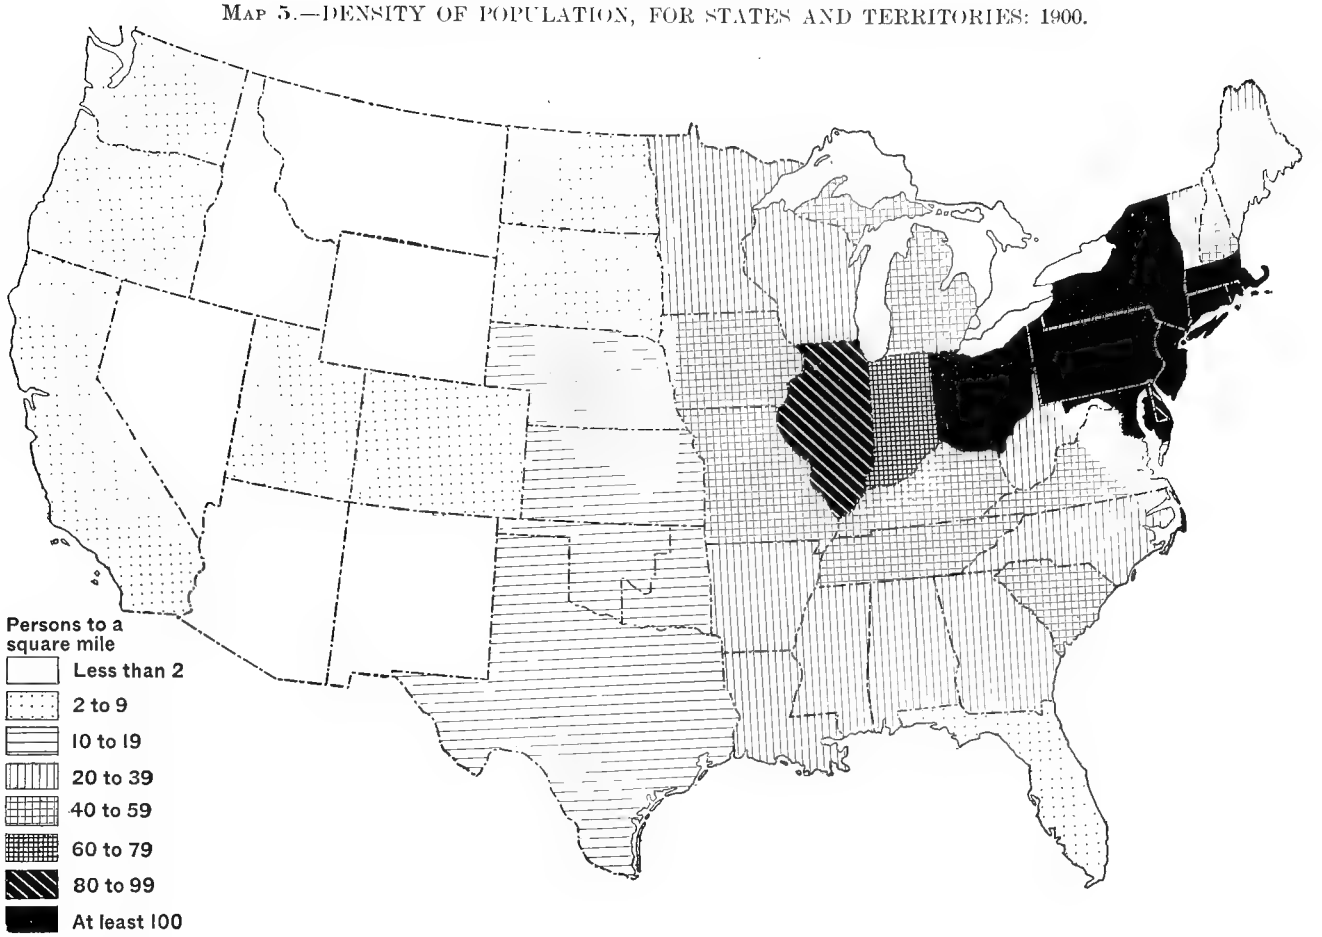
Outlying districts.—Among the outlying districts the density of population is as follows:

TABLE I. —*Density of population in outlying districts of the United States about 1900.*

DISTRICT.	Date of census or estimate	Density of population.
Alaska	1900	0.1
Hawaii	1900	23.9
Guam	1900	144.8
Philippine Islands	1903	66.4
Samoa	1901	[1]75.3
Porto Rico	1899	277.5

[1] Estimate.

From the figures it is evident that the density of population in these districts varies widely. Few parts of the earth, taken as a whole, are more uninhabited than Alaska, and few are more thickly settled than Porto Rico. As a subsequent table shows, Porto Rico has more persons to a square mile than any American state except Rhode Island and Massachusetts.



Continental United States. In continental United States, as distinguished from the outlying districts just described, the average density of population is about 26 (25.6), or little short of the average of the earth as a whole. In Table II a comparison is made between the density of population of continental United States and of the other powers which had a population of

[1] "No more employees shall be required or permitted to work in a room in a factory . . . than will allow to each of such employees not less than 250 cubic feet of air space." (New York Laws, 1891, chapter 9, section 85.)

[2] "There is an average of 5.3 persons to a dwelling in 1900." (Twelfth Census, Vol. II, page clvi.)

[3] "There is an average of 0.7 person to each room in the occupied tenements." (Census of Massachusetts, 1895, Vol. I, page 781.)

MAP 5.—DENSITY OF POPULATION, FOR STATES AND TERRITORIES: 1900.

over 25,000,000, or an area of 500,000 square miles. The countries are arranged in order of decreasing density of population.

TABLE II.—*Density of population in various countries at dates specified.*

COUNTRY.	Date of census or estimate.	Density of population.
United Kingdom	April 1, 1901	343.8
Japan	December 31, 1900	[1] 303.5
Italy	February 10, 1901	293.5
German Empire	December 1, 1900	269.9
China	About 1900	[1] 265.8
India	March 15, 1901	213.3
France	March 24, 1901	188.2
Austria-Hungary	December 31, 1900	188.1
Continental United States	June 1, 1900	25.6
Turkey	About 1900	[1] 24.5
Mexico	October 28, 1900	17.7
Persia	1881	[1] 12.2
Colombia	1881	[1] 7.7
Brazil	1890	4.5
Venezuela	1891	3.9
Argentina	May 10, 1895	3.5
Bolivia	September 1, 1900	2.6
Canada	April 1, 1901	1.5
Australia (commonwealth)	1901	1.3

[1] Estimate.

Inspection of this table shows that the large and populous countries of the world may be divided from the point of view of their density of population into two classes, the first including five countries in Europe and three in Asia, in which the density of population is over 100, or as will appear later between that of New York state (153) and that of Massachusetts (349); the second including 11 sparsely settled countries, 8 in the Western Hemisphere, with a density of population between that of Arizona (1) and that of Arkansas (25). Of these 11 countries the United States is the most densely peopled, and yet its average density of population is only about one-seventh that of the most sparsely settled country in the first class, Austria-Hungary.

States and territories.—In Table III the density of population in the 50 states and territories constituting continental United States is given, the divisions being arranged in the order of decreasing density.

TABLE III.—*Density of population, for states and territories in order of decreasing density: 1900.*

STATE OR TERRITORY.	Density of population: 1900.	STATE OR TERRITORY.	Density of population: 1900.
Continental United States	25.6	Georgia	37.6
		Alabama	35.5
District of Columbia	4,645.3	Mississippi	33.5
Rhode Island	407.0	Louisiana	30.4
Massachusetts	348.9	Arkansas	24.7
New Jersey	250.3	Maine	23.2
Connecticut	187.5	Minnesota	22.1
New York	152.6	Kansas	18.0
Pennsylvania	140.1	Nebraska	13.9
Maryland	120.5	Indian Territory	12.6
Ohio	102.0	Texas	11.6
Delaware	94.3	Oklahoma	10.3
Illinois	86.1	Florida	9.7
Indiana	70.1	California	9.5
Kentucky	53.7	Washington	7.7
Tennessee	48.4	South Dakota	5.2
Virginia	46.2	Colorado	5.2
New Hampshire	45.7	North Dakota	4.5
Missouri	45.2	Oregon	4.4
South Carolina	44.4	Utah	3.1
Michigan	42.2	Idaho	1.9
Iowa	40.2	Montana	1.7
North Carolina	39.0	New Mexico	1.6
West Virginia	38.9	Arizona	1.1
Wisconsin	38.0	Wyoming	0.9
Vermont	37.6	Nevada	0.4

The average density of the population in continental United States is 25.6, or about that of Arkansas. The table shows, however, that there are comparatively few states in which the density of population comes close to the average for the whole country. While there are but 3 states in which the density of population lies between 20 and 30, there are 8 in which it lies between 30 and 40, and 7 in which it lies between 40 and 50. Accordingly, what may be called the typical or most usual density of population of the United States may be stated as about 40. The total population of the states in which the density of population lies between 30 and 50 is 25,629,420, or 33.7 per cent of the total population of continental United States.

The geographical relation of the states and territories in order of density of population is shown by Map 5, in which the states and territories are marked in eight shades, the lightest representing the thinly settled area, less than 2 to a square mile, while the darkest represents that part of the country in which the density of population approached that of western Europe more nearly than it does the average for the United States as a whole. The region of highest density includes the states and territories along the Atlantic coast from the Merrimac river to the Potomac, except Delaware, and inland across Ohio. The second class, states having a density of population of between 80 and 100, includes only Delaware and Illinois; the third class, those having between 60 and 80 to a square mile, only Indiana. The area in which the average density of population for a state is above 60, thus extends from the Atlantic coast westward between the Great Lakes and the Potomac and Ohio rivers to the Mississippi. Both north and south of this central area the density of population is less. Indeed, a central belt somewhat more densely settled than the region to the north or south of it may be traced from the Atlantic coast as far west as Utah. For, while the map does not indicate it, the table shows that the density of population in Oklahoma, Indian Territory, and Texas is less than that in Kansas or Nebraska. The advantages to trade and industry from having the region of greatest density in a central belt rather than along the frontiers are suggested by a comparison between the distribution of well-settled areas in the United States and those in Australia or Spain, where the region of dense settlement makes approximately a girdle around a sparsely settled inland district.

Physiographic divisions. Table IV gives the 19 physiographic divisions[1] into which continental United States has been divided for purposes of the present report, arranged in order of decreasing density of population.

It will be noticed that there is a sharp break in the series between the regions east of the eastern boundary of the Great plains, all west of that having a density of population below and in most cases much below that of the average for the entire country, while all east of that have a density of population almost, if not quite, as high as the average for the entire country, the three east of the line in which the density is below the average for the country, being the western division of the Coastal plain, the Ozark hills, and the marshy Coast lowlands. The gap between these two regions is partly bridged by the two westernmost divisions, the Coast ranges, and the Pacific valley.

[1] Description and map on pages 11 to 14.

TABLE IV.—*Density of population in physiographic divisions of continental United States: 1900.*

DIVISION.	Density of population: 1900.
Continental United States	25.6
New England hills	124.1
Appalachian valley	82.5
Piedmont region	75.7
Interior timbered region	68.7
Allegheny plateau	61.0
Lake region	55.2
Coastal plain (east of the Mississippi river)	38.5
Mississippi alluvial region	29.4
Prairie region	29.2
Coastal plain (west of the Mississippi river)	22.5
Coast lowlands	22.5
Ozark hills	19.4
Coast ranges	17.8
Pacific valley	9.3
Columbian mesas	3.2
Great plains	2.3
Rocky mountains	2.0
Great basin	1.6
Plateau region	1.1

Counties.—There are 30 counties in continental United States with more than 500 persons to a square mile. With the exception of San Francisco, Cal.; Orleans, La.; Fulton, Ga.; and Alexandria, Va., all these counties are east of the Mississippi and north of the Ohio and Potomac rivers. Table v gives the 30 counties in order of decreasing density of population:

TABLE V.—*Density of population for counties arranged in order of decreasing density: 1900.*

COUNTY.	Density of population: 1900.	COUNTY.	Density of population: 1900.
New York, N. Y.	32,549.2	Allegheny, Pa.	1,022.5
Baltimore city, Md.	16,965.2	Hamilton, Ohio	1,011.1
Kings, N. Y.	15,140.4	Ramsey, Minn.	991.6
Suffolk, Mass.	11,988.6	Union, N. J.	964.6
Philadelphia, Pa.	9,951.5	Cuyahoga, Ohio	930.3
St. Louis city, Mo.	9,430.1	Providence, R. I.	799.7
Hudson, N. J.	8,977.9	Passaic, N. J.	783.8
San Francisco, Cal.	7,293.2	Middlesex, Mass.	703.6
District of Columbia	1,645.3	Essex, Mass.	694.6
Essex, N. J.	2,827.2	Fulton, Ga.	674.5
Cook, Ill.	1,851.7	Alexandria, Va.[1]	654.9
Orleans, La.	1,457.1	Jefferson, Ky.	626.8
Milwaukee, Wis.	1,447.1	Wayne, Mich.	557.2
Queens, N. Y.	1,186.0	Delaware, Pa.	532.4
Richmond, N. Y.	1,175.8	Bristol, R. I.	525.8

[1] Includes Alexandria city.

The density of population in New York county, N. Y. is about twice as great as for Baltimore city, Md., or Kings county, N. Y., and almost three times that for Suffolk county, Mass., which contains the cities of Boston and Chelsea. The average density is not far from the same in Philadelphia, Pa.; St. Louis, Mo.; San Francisco, Cal.; and Hudson county, N. J., which includes Jersey City, Hoboken, and Bayonne.

INCREASE OF POPULATION.

The most decisive mark of the prosperity of any country is the increase of the number of its inhabitants.—*Adam Smith.*

The United States . . . have had the idea of a periodical census and as a result we have before us . . . this phenomenon of an unprecedented increase of population, which is perhaps the greatest political and economic fact of the age.—*Sir Robert Giffen.*

SUMMARY OF RESULTS.

For census purposes increase means the number by which the members of any statistical class at one census exceed those in the same class at the preceding census. The statistical class can be and is defined in diverse ways for different purposes, thus giving rise to different sorts of increase.

The increase in the population of the United States between 1890 and 1900 was about twenty-two millions.

Of this increase two-fifths was due to the extension of the boundaries of the United States in the decade 1890 to 1900, and the other three-fifths to the increase of population within the boundaries of 1890.

The increase in the population of continental United States—that is, the United States exclusive of Alaska and the recent insular accessions (Hawaii, Philippine Islands, Porto Rico, Guam, and Samoa)—was 13,046,861, or 20.7 per cent.

Only one country, Argentina, has shown by the most recent figures a more rapid rate of growth.

The present rate of growth in continental United States is probably double the average rate of Europe, is nearly double that of Canada, exceeds by one-sixth that of Mexico, and by one-tenth that of Australia.

Owing to the rapid decline in the rate of increase in the population of continental United States since the Civil War, and the probable rise in that of Europe within the same period, the rates of increase on the two sides of the northern Atlantic differ much less than they did a generation ago.

Among the five main divisions of continental United States the highest rate of increase is found in the Western division and the lowest in the North Central.

Among the 11 minor divisions the highest rate of growth is found in the Rocky Mountain group of states, closely followed by the Western South Central; the lowest in the Northern South Atlantic, closely followed by the Western North Central.

In 1790 the northern and the southern groups of states had almost equal populations, but through the following hundred years—with an insignificant and probably only apparent exception in one decade—the North steadily gained, until in 1890 its population was almost double that of the South.

In the decade 1890 to 1900, on the contrary, for the first time in our national history the Southern states increased faster than the Northern, if allowance be made for the undercount in 1870.

East of the Mississippi, however, the Northern states as a group have grown in the last ten years somewhat more rapidly than the Southern; but west of that river the Southern states have increased almost two and one-half times as rapidly as the Northern, and it is this fact which makes the growth of the South as a whole exceed that of the North.

In the North Atlantic division the rate of increase has risen steadily since the Civil War, a notable contrast to the trend in the country as a whole.

The region west of the Mississippi river is still increasing faster than that east of it, but the difference between the rates of growth in the two regions, 1890 to 1900, was little more than one-fifth of what it was, 1880 to 1890.

The region east of the Mississippi increased more rapidly from 1890 to 1900 than from 1880 to 1890, while that west of the Mississippi increased in the later decade not much more than half as fast as in the earlier.

The increased growth of the East and the decreased growth of the West may both be connected with a probable decline in the current of westward migration.

While the rate of increase for continental United States, 1890 to 1900, was 20.7 per cent, the rate of increase shown by the largest number of counties was from 4 to 5 per cent. The most usual or the typical rate of growth for an American county, therefore, is about 5 per cent.

Between 1890 and 1900 one-half of the counties of the United States either decreased or had an increase of not more than 14.9 per cent.

The rates of increase in the North and the South during the last twenty years were practically the same. But in the character of this growth the two regions differ widely, there being a relatively uniform growth over the whole South, equalized by a balance in the

North between a lower rate of rural growth and a higher rate of urban growth.

The counties losing population, 1890 to 1900, formed 10.9 per cent of the area of continental United States; the corresponding per cent for the period, 1880 to 1890, was 12.4. The growth of population, an important index of prosperity, was more evenly distributed over the country between 1890 and 1900 than between 1880 and 1890.

Extensive but sparsely settled areas in the western parts of Kansas, Nebraska, and South Dakota show a decline of population in the last ten years, a fact which may be connected with the increase of population in many agricultural counties of Iowa, Illinois, and adjoining states, 1890 to 1900, after losing population during the preceding ten years.

Between 1890 and 1900 the per cent of increase in the population of all cities having at least 2,500 inhabitants was only about two-thirds of what it was between 1880 and 1890 (35.6 per cent compared with 53.8 per cent). The increase in the aggregate population living outside of such cities was approximately the same for the two decades (12.4 per cent for 1890 to 1900, and 12.9 per cent for 1880 to 1890).

The most noteworthy result of the entire discussion is the cumulative evidence of the rapid approach to equality in the rates of increase of various parts of the United States. This appears whether North be compared with South, East with West, or city with country.

DISCUSSION OF INCREASE.

Definition. The increase of population is measured by comparing the results of two or more successive censuses. In the United States it is popularly taken to be the number of people at one census in excess of the number at the census immediately preceding, regardless of changes in area. But as pointed out in another place,[1] the United States, while remaining the same sovereign power, has by no means remained the same in a territorial sense. At the date of the Eleventh Census, it included continental United States and Alaska; when the law for the Twelfth Census was passed it had added the outlying district of Hawaii, and when the Twelfth Census was taken it had added four more outlying districts, namely, Porto Rico, the Philippine Islands, Guam, and Samoa. Under such conditions the meaning to be attached to increase depends upon the point of view. If the legal or constitutional point of view be emphasized, an extension of boundaries may be neglected; but if the territorial or geographical point of view be made prominent, it is important that the territory on which the population lives should be identical at the dates of the several censuses.

[1] Page 3.

In measuring the increase in the population of the United States and of the several states and territories, either point of view may be taken; but when the geographical point of view is taken for counties, and especially for cities, difficulties arise. For example, suppose the problem be to measure the decennial increase in the population of cities having at least 25,000 inhabitants. In 1890 there were in continental United States 124 such cities; in 1900 the number had increased to 160. Is it proper to compare the total population in 1890 of the 124 with the total population in 1900 of the 160, or should the population of the same cities at each census be taken? In the latter case, should the 124 cities or the 160 cities be made the basis? If the same cities are used, is identity of name sufficient, or is identity of territory also requisite? Is the population of New York city to be given for 1890 without that of Brooklyn and the other annexed territory, and for 1900 with it? If identity of territory as well as of name is required, the problem of ascertaining the population in 1890 living on all territory which in 1900 was included within the municipal boundaries of the 160 cities becomes difficult, if not insoluble.

The answers to such questions depend upon and vary with the object. The social and economic life of people living in cities of at least 25,000 inhabitants has certain common features. For census purposes, residents in such cities constitute a statistical class, the size of which is measured at each census. This class increases in several ways and the census figures show the resultant of them all. If information is sought regarding the prominence of this class in the body politic at successive dates, it is entirely correct to compare the population of the 124 cities in 1890 with that of the 160 cities in 1900. But if the object is to ascertain the average rate of increase of cities of this class, then the cities should be the same and correction be made for changes of boundaries.

The increase in a large and growing population group can be and usually is of two kinds — an increase by excess of births over deaths, often called natural increase, and an increase by excess of immigrants over emigrants, which might be termed increase by migration. An effort is sometimes made to ascertain from census figures how much of the increase is natural and how much is by migration. See, for example, Twelfth Census, Volume III, pages xlix et seq. But on this point it is almost impossible to reach closely approximate conclusions unless the census figures be supplemented — as they are not in the United States — both by careful records of births and deaths and by careful records of immigrants and emigrants.

For census purposes, then, increase means the number by which the members of any statistical class at one census exceed those in the same class at the preceding

census. The statistical class can be defined in diverse ways, as, for example: (1) Identical relationship to the National Government taking the census, whether or not the territory be the same; (2) residence on an identical territory; (3) either of these plus one or more common characteristics determined by the census. An example of the first form of increase is the statement that the population of the United States increased between 1840 and 1850 by 6,122,423, a large part of this being due to the annexation of Texas; an example of the second form is the statement that the population of Greater New York showed an increase in 1900 of 929,788 over the population living on the same area in 1890;[1] an example of the third form is the statement that the foreign born population of continental United States increased between 1890 and 1900 by 1,091,716.

Under these circumstances it seems best to begin with a consideration of increase of the simplest and most easily measured form, and to carry on the analysis to a point where the significance of the results is outweighed by the difficulty and expense of reaching them.

United States.—The following table gives the area and population of the United States at each of the twelve censuses, and the increase in area and in population for each of the eleven decades since 1790. In 1820 the population of Florida, in 1870 that of Alaska, and prior to 1890 that of Indian Territory and the Indian reservations was not included in the census.

TABLE I.—*Area and population of the United States: 1790 to 1900.*

CENSUS.	Area, square miles.[1]	Population.	INCREASE DURING PRECEDING TEN YEARS IN—		
			Area, square miles.	Population.	
				Number.	Per cent.
1900[2]	3,686,306	84,907,156	125,384	21,927,390	34.8
1890	3,560,922	62,979,766	.....	12,790,537	25.5
1880	3,560,922	50,189,209	.....	11,630,838	30.2
1870[3]	3,560,922	38,558,371	590,884	7,115,050	22.6
1860[4]	2,970,038	31,443,321	31,017	8,251,445	35.6
1850[5]	2,939,021	23,191,876	1,186,674	6,122,423	35.9
1840	1,752,347	17,069,453	.....	4,203,433	32.7
1830	1,752,347	12,866,020	.....	3,227,567	33.5
1820[6]	1,752,347	9,638,453	54,240	2,398,572	33.1
1810[7]	1,698,107	7,239,881	878,641	1,931,398	36.4
1800	819,466	5,308,483	.....	1,379,269	35.1
1790	819,466	3,929,214	.....	.....	.....

[1] Figures include the land surface of continental United States and the land and water surface of the outlying districts.

[2] Territory extended by the annexation of Hawaii, the Spanish cession of Porto Rico, the Philippine Islands, and Guam, and the convention between the United States, Germany, and Great Britain regarding Samoa; land surface extended by the draining of Lake Tulare in California.

[3] Territory extended by the Alaska purchase; population not included until the census of 1880.

[4] Territory extended by the Gadsden purchase.

[5] Territory extended by the annexation of Texas (385,926 square miles), the Mexican cession (520,068 square miles), and the extinction of the British claims to the Oregon territory (280,680 square miles). The Oregon territory was claimed by discovery, 1792; exploration, 1805; Astoria settlement, 1811; and the Spanish cession of 1819.

[6] Territory extended by the Florida purchase; population not included until the census of 1830.

[7] Territory extended by the Louisiana purchase.

The preceding table measures the increase of the United States as a nation, not as an unchanging part of the earth's surface. In fact, the columns showing area and increase of area measure the steps by which a country which in 1790 embraced less than one-sixtieth (1.6 per cent) of the land surface of the earth has extended to include in 1900 nearly one-fourteenth (7.0 per cent) of that surface. The difference in the sort of increase measured accounts for the differences between certain figures in Table I and those given in Twelfth Census, Volume I, Tables 1 and 2.

The column giving increase in area shows that during 6 of the 11 decades between 1790 and 1900 the United States extended its territorial limits. The most important accession was the Louisiana purchase, in the second decade of our history. The only other increase of area comparable in amount and importance was that resulting from the annexation of Texas, and the Mexican War, and the extinction of the British claims to the Oregon territory. The column showing numerical increase in population indicates that the increase itself increased at each decade from 1790 to 1900, with the single exception of the decade including the Civil War.

While the United States in its life as a nation has extended its boundaries several times, it was not until the last decade that it added in this way a great number of people. The sudden jump in the increase from less than 13,000,000 between 1880 and 1890 to over 21,000,000 between 1890 and 1900 was due mainly to the new population brought into the United States as a result of the Spanish-American War.

The only countries that have unquestionably both a greater area and a more numerous population than the United States are the British Empire, the Chinese Empire, and the Russian Empire. France has a slightly larger population than the United States, but whether with its various possessions it also has a greater area is uncertain.[2] It is impossible to state with confidence the exact increase of population in the Chinese Empire or the Russian Empire. The population of the former is usually believed by competent authorities not to have increased in recent decades; if the official estimates of the population of Russia in 1887 are correct, and comparable with the results of the first Russian census, that of 1897, the rate of decennial increase of population in Russia is 13.8 per cent; the rate of increase in the British Empire, 1891 to 1901, is 4.6 per cent, determined mainly by British India, which includes three-fourths (74.3 per cent) of the population of the Empire.

The numerical increase in the population of the United States between 1890 and 1900, as shown in Table I (21,927,390), was probably greater than that of any other country. This figure may be analyzed as follows: Increase within the limits of the United States as they stood June 1, 1890, 13,078,401; persons stationed abroad in 1900, 91,219; increase due to the inclusion of new territory (Hawaii, Porto Rico, the Philippine Islands, Guam, and Samoa), 8,757,770. Thus two-fifths (39.9 per cent) of the increase in the population of the United States, 1890 to 1900, is due to accession of territory.

[1] Twelfth Census: Abstract, page 101, footnote 2; Vol. I, page lxxx.

[2] Table II, page 5, and Table II, page 17.

Outlying districts.—As explained at length on page 3, the United States has been divided, for purposes of this report, into continental United States and the outlying districts. There are 6 outlying districts, and the increase or decrease of population has been determined by the census in 4 of them—Alaska, Hawaii, the Philippine Islands, and Porto Rico—and is unknown in 2—Guam and Samoa.

The following table gives the figures for the first 4 districts:

TABLE II.—*Increase in the population of outlying districts.*

DISTRICT.	LATEST CENSUS.		PRECEDING CENSUS.		Increase of population.	Per cent of decennial increase of population.
	Date.	Population.	Date.	Population.		
Alaska	1900	63,592	1890	32,052	31,540	98.4
Hawaii	1900	154,001	1890	89,990	64,011	71.1
Porto Rico	1899	953,243	1887	798,565	154,678	15.9
Philippine Islands	1903	7,635,426	1887	[1] 6,984,727	650,699	6.0

[1] Including 1,000,000 as the estimated population of the unenumerated wild tribes.

It may be more than a coincidence that the rate of growth in these outlying districts is high or low according as they have been for a longer or shorter time included within the United States. In the last ten years Alaska has nearly doubled in population, while for the sixteen years prior to 1903 the Philippine Islands increased very slowly.

Continental United States.—As the population of Indian Territory and the Indian reservations has been reported by the census only for 1900 and 1890, it is impossible to state exactly the total increase in the population of continental United States, except for the last ten years. In 1890 the population was 62,947,714, in 1900 it was 75,994,575. The decennial increase was 13,046,861, or 20.7 per cent.

The following figures show how this rate of growth compares with that of certain foreign countries the areas of which have remained substantially unaltered during the period covered:

TABLE III.—*Increase in the population of certain foreign countries.*

COUNTRY.	LATEST CENSUS.		PRECEDING CENSUS.		Increase of population.	Per cent of decennial increase of population.
	Date.	Population.	Date.	Population.		
Argentina	1895	3,954,911	1869	1,736,922	2,217,989	37.2
Australia (commonwealth)	1901	3,767,443	1891	3,174,253	593,190	18.7

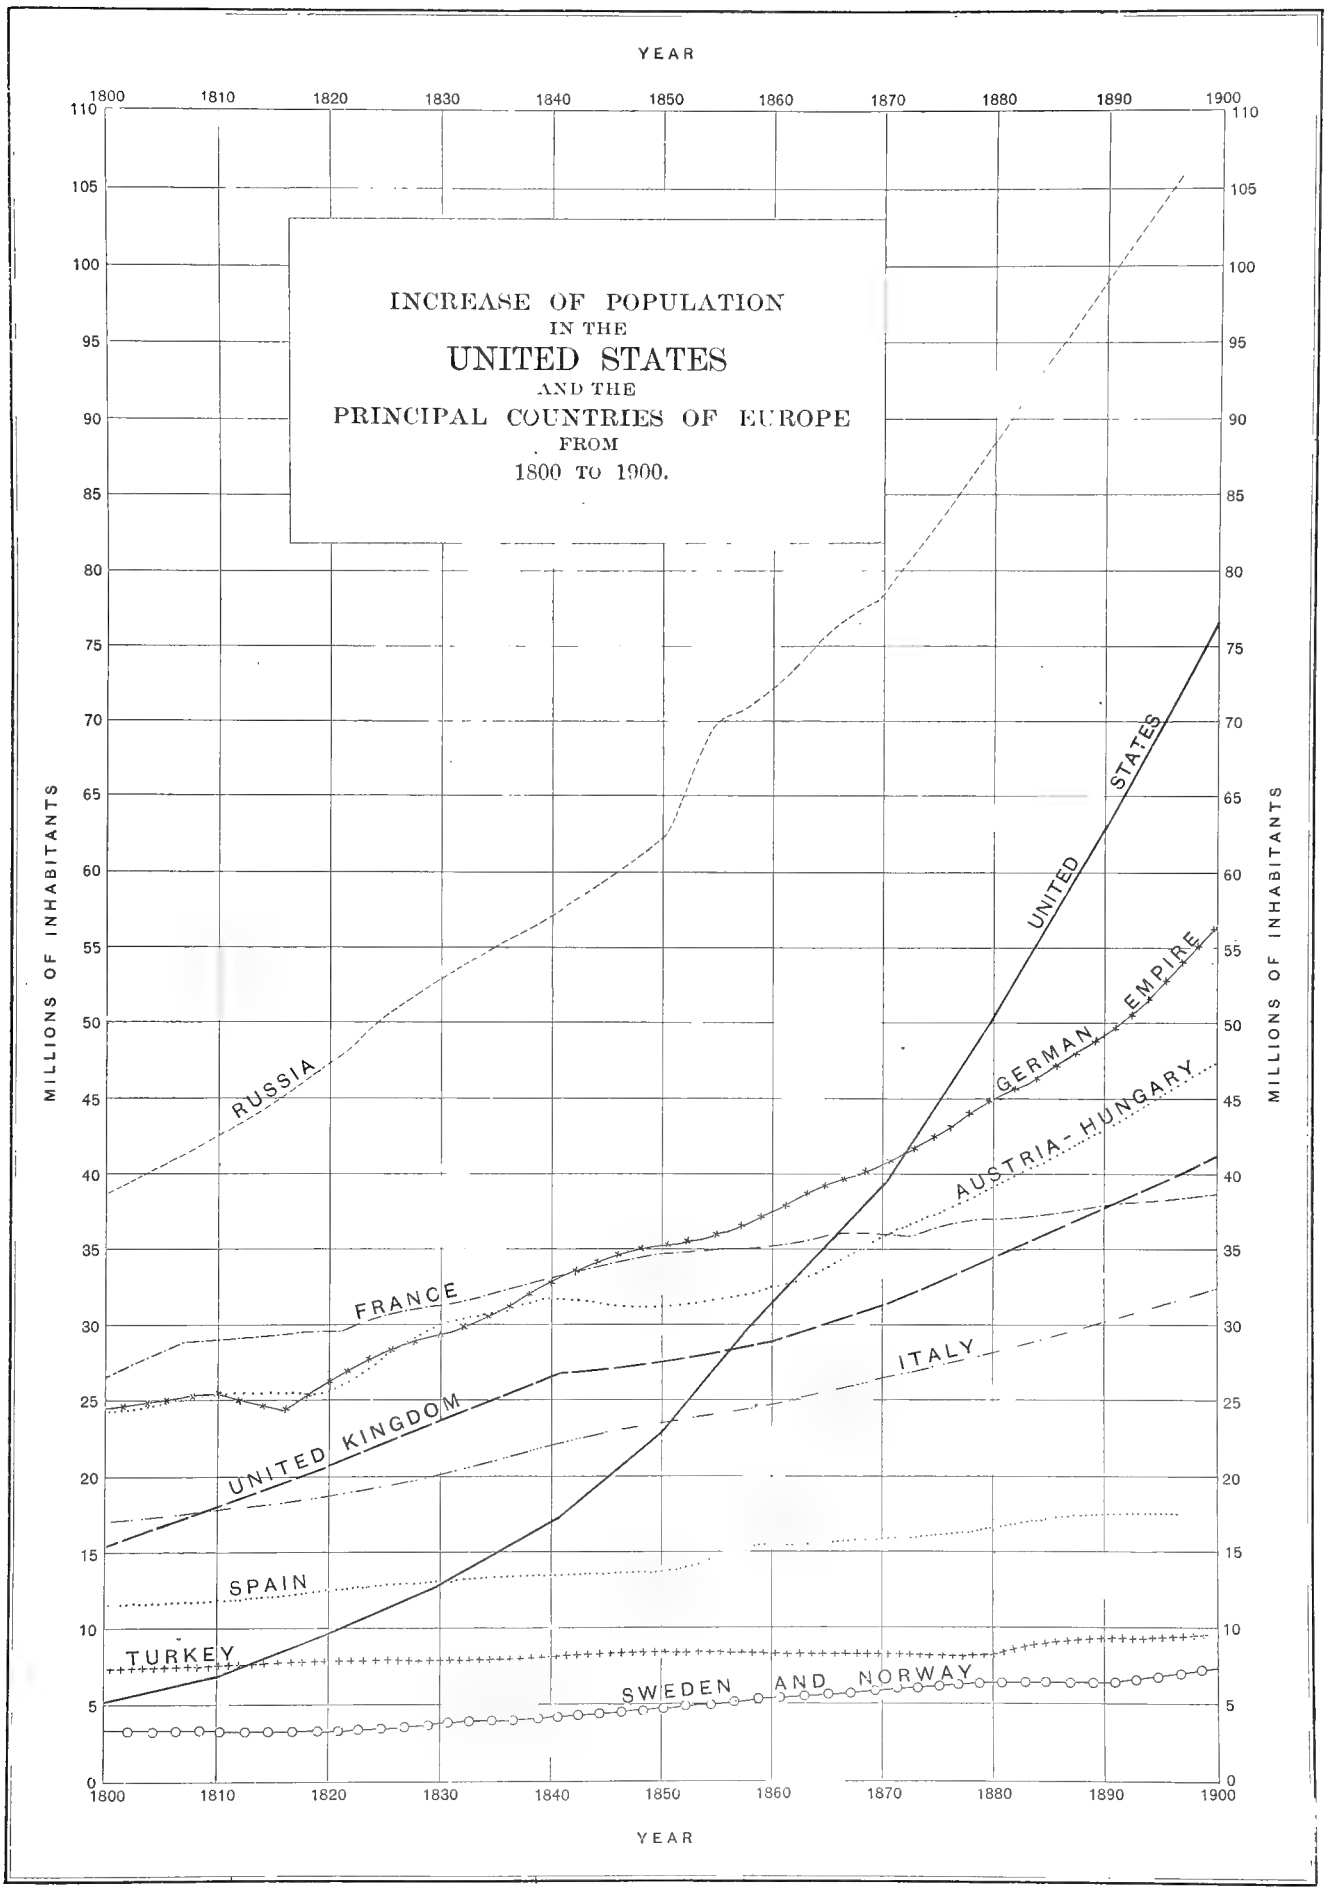
[1] Decrease.

The figures of the preceding table have been derived in part from official publications of the countries named, in part from reports of United States consuls transmitted to the Census Office through the courtesy of the Department of State, and in part from the best available secondary sources. The table shows that only one of these countries is now increasing in population more rapidly than continental United States. It is probable that were more recent census figures for Argentina available, its rate of increase would be found to be lower than that of the United States. The rates of growth in the two neighbors of this country, Mexico and Canada, are noticeably less than the rate in the United States. Even Australia is increasing at present less rapidly than this country.

The population of all Europe at recent dates has been carefully estimated by MM. Levasseur and Bodio[1] with the following results:



DATE.	Population of Europe.
1900	401,098,000
1886	346,700,000
1880	331,000,000
1878	325,700,000
1860	289,000,000

According to the foregoing figures the population of Europe increased 14.5 per cent between 1860 and 1880, and 21.2 per cent between 1880 and 1900. The population of continental United States increased 59.5 per cent in the earlier twenty-year period and 51.5 per cent in the later. The present rate of decennial increase in Europe derived from the estimates of population for 1886 and 1900 is 11.0 per cent, or a little more than half that in continental United States, namely, 20.7. The figures indicate, however, that the rate of increase in Europe has risen since 1860, while that of the United States has fallen. In this respect, therefore, the conditions on the two sides of the northern Atlantic have been approaching equality.

Diagram 1, adapted from Hübner's Geographisch-Statistische Tabellen for 1901, illustrates the increase of population during the nineteenth century in the United States and the leading countries of Europe. The figures on which the diagram is based are those for the population of the European or American territory which was included in 1900 within the limits of the country named. This explains why the population is indicated throughout for countries like Italy and the German Empire, although they had no political existence when the century opened. The foreign possessions of European powers and the recent accessions of the United States are disregarded.

The Austrian editor comments upon the preceding diagram as follows:

> It shows at a glance that the United States of America, Russia, and the German Empire have rapidly forged to the front, and that the increase of population in the United Kingdom, in Italy, and, especially since 1860, in Austria-Hungary, has been marked, while that of France and Spain has been slower.

At the beginning of the nineteenth century Russia, France, Germany, Austria, the United Kingdom, Italy, and even Spain and Turkey, had larger populations than the United States; at the beginning of the twentieth century the United States had outstripped all but Russia, and was increasing with somewhat greater rapidity than that power. The comparative straightness of the line representing the increase in the population of the United States during the last three decades indicates that the increase during each of those decades was not far from the same.

Geographic divisions.—As explained in a former section the territory of continental United States has been divided, for purposes of statistical treatment, into 5 main and 11 minor divisions. The states and territories included in each division are given in that section (page 10), and are also indicated on Map 1, the boundaries of the main divisions being represented by heavy lines, and those of the minor divisions, where they do not coincide with those of the main divisions, by lighter lines.

Table IV gives the population of the main and minor geographic divisions in 1900 and 1890, and the increase. The figures for 1900 agree with those in Twelfth Census, Volume I, Table VII, page xxii, but those for 1890 differ by including the population of Indian Territory and the Indian reservations. As a result, certain figures for increase differ slightly from those in Table VIII of the same volume.

TABLE IV.—*Population of main and minor geographic divisions: 1890 to 1900.*

DIVISION.	POPULATION.		INCREASE, 1890 TO 1900.	
	1900	1890[1]	Number.	Percent.
Continental United States	75,994,575	62,947,714	13,046,861	20.7
North Atlantic division	21,046,695	17,406,969	3,639,726	20.9
New England	5,592,017	4,700,749	891,268	19.0
Southern North Atlantic	15,454,678	12,706,220	2,748,458	21.6
South Atlantic division	10,443,480	8,857,922	1,585,558	17.9
Northern South Atlantic	4,464,481	3,860,049	604,432	15.7
Southern South Atlantic	5,978,999	4,997,873	981,126	19.6
North Central division	26,333,004	22,410,417	3,922,587	17.5
Eastern North Central	15,985,581	13,478,305	2,507,276	18.6
Western North Central	10,347,423	8,932,112	1,415,311	15.8
South Central division	14,080,047	11,170,137	2,909,910	26.1
Eastern South Central	7,547,757	6,429,154	1,118,603	17.4
Western South Central	6,532,290	4,740,983	1,791,307	37.8
Western division	4,091,349	3,102,269	989,080	31.9
Rocky Mountain	1,232,642	867,558	365,084	42.1
Basin and Plateau	442,015	346,377	95,638	27.6
Pacific	2,416,692	1,888,334	528,358	28.0

[1] Includes population of Indian Territory and Indian reservations.

Among the 5 main divisions the Western shows the highest rate of increase, but its preeminence is not great. The next highest rate is in the South Central group. The lowest rate is found, not as might have been anticipated, in either Atlantic coast division, but in the North Central, in which the rate of growth is noticeably less than in the North Atlantic division and slightly less than in the South Atlantic. In these 5 divisions the increase in population ranges from one-sixth to one-third.

Among the 11 minor divisions the most rapid growth has been in the Rocky Mountain, followed closely by the Western South Central. In the North Central division the growth east of the Mississippi has been more rapid than that west of it, but in the South Central the relation is reversed, the states west of the Mississippi having increased more than twice as rapidly as those east of it. In rate of growth four of the five trans-Mississippi divisions have the leading positions, but the fifth, the Western North Central, shows a rate lower than that of any other except the Northern South Atlantic, and almost as low as for that division. The increase in population for these 11 divisions ranges from one-seventh to three-sevenths.

From Table IV it is possible to compute the per cent of increase in the population of various larger areas. Thus the increase, 1890 to 1900, for the Atlantic coast states was 19.9 per cent; for the Central states, 20.3; for the Western states, 31.9. The increase for the Central states east of the Mississippi was 18.2 per cent; that for the Central states west of the Mississippi was 23.5. The total population east of the Mississippi increased in the last decade by 19.2 per cent; that west of the Mississippi, by 25.0. These figures show that the rate of growth is higher in the central and western parts of the country than in the eastern, but that the difference is not marked.

The increase for the four northern groups was 19.0 per cent; that for the four southern groups was 22.4 per cent. While the North Atlantic states are increasing more rapidly than the South Atlantic, and the Eastern North Central more rapidly than the Eastern South Central, on the other hand the Southern states west of the Mississippi are increasing almost two and one-half times as rapidly as the states north of them, and it is this great difference which makes the rate of growth for the South greater than that for the North.

In Table V the per cent of increase in the population of each main and minor geographic division is given for each decade from 1790 to 1900. The censuses prior to 1890 did not include the population of Indian Territory or the Indian reservations, but this produces only a slight and negligible error in the comparison. For 1890 two sets of figures have been used: One, for comparison with the figures for 1880, excluding the population of Indian Territory and the Indian reservations; and the other, for comparison with the figures for 1900, including the population of those areas. The figures from which these per cents have been derived are given in Table XXX, page 61.

TABLE V.—PER CENT OF INCREASE OF POPULATION FOR MAIN AND MINOR GEOGRAPHIC DIVISIONS: 1790 TO 1900.

DIVISION.	PER CENT OF INCREASE OF POPULATION.

Western division	31.9	71.3	78.5	60.0	246.1	.....	.....	.....	.....	.....	.....
Rocky Mountain	42.1	107.4	130.3	38.1	107.6	.....	.....	.....	.....	.....	.....
Basin and Plateau	27.6	27.0	77.5	194.8	314.1	.....	.....	.....	.....	.....	.....
Pacific	28.0	67.9	65.1	52.0	319.3	.....	.....	.....	.....	.....	.....

The preceding table shows that the rate of growth in the population of continental United States was highest from 1800 to 1810 and lowest from 1890 to 1900. Between 1790 and 1860 it was nearly constant, being, for each decade, between 32 and 37 per cent. For each decade since 1860 (allowing for omissions in the count of 1870) it has probably been below 30 per cent. It has also declined, at least since the decade, 1870 to 1880.

In the North Atlantic division and in each of its parts the rate of increase was highest between 1790 and 1800, and lowest between 1860 and 1870, the decade of the Civil War; since that period it has been rising steadily, a noteworthy contrast to the trend in the country as a whole. In the South Atlantic division the rate of growth was lowest for the decade from 1830 to 1840, and, if the figures for 1870 to 1880 be disregarded as of doubtful accuracy, the growth in this division, as in the North Atlantic, was highest for the decade from 1790 to 1800.

The fact that the most rapid growth in continental United States occurred in the decade from 1800 to 1810 is due largely to the great increase during that decade in the two Central divisions. Their total increase from 1790 to 1800 was 277,045, but from 1800 to 1810 it was 691,902. In the two parts of the North Central division the maximum rate of growth was in the first decade for which figures appear, and the minimum in the last decade of the century; between these limits the rate almost steadily declined. In the South Central division and both of its parts, on the contrary, while the maximum was reached in the earliest decade, the minimum (disregarding the figures for 1860 to 1870) was reached in the decade from 1880 to 1890, the decade ending with 1900 showing an increased rate of growth both east and west of the lower Mississippi.

If a statistical measure of frontier growth is desired, the frontier may perhaps be assumed to include all large areas the population of which more than doubled in the preceding ten years. Under this definition it appears from Table v that the Eastern South Central states were included in the frontier from 1790 to 1810; the Eastern North Central, from 1800 to 1820; the Western South Central, from 1810 to 1820 and 1840 to 1850; the Western North Central, from 1810 to 1860; the Pacific, from 1850 to 1860; the Basin and Plateau, from 1850 to 1870; and the Rocky Mountain, from 1850 to 1860 and 1870 to 1890. During the present decade there was no one of the 11 minor divisions of the United States in which the conditions of growth were those of the frontier, as thus defined.

Table v has been supplemented by Table vi, which gives figures for each twenty-year period between 1800 and 1900, avoiding the use of the questionable returns for 1870 and affording a briefer and clearer survey of the differences, local and temporal, in the growth of American population during the nineteenth century.

TABLE VI.—*Per cent of increase of population by twenty-year periods, for main and minor geographic divisions: 1800 to 1900.*

DIVISION.	PER CENT OF INCREASE OF POPULATION.				
	1880 to 1900	1860 to 1880	1840 to 1860	1820 to 1840	1800 to 1820
Continental United States	51.5	59.5	84.2	77.1	81.6
North Atlantic division	45.1	36.9	56.7	55.1	65.4
New England	39.1	27.9	40.3	34.6	31.6
Southern North Atlantic	47.2	40.7	64.8	67.6	92.5

Western division	131.5	185.6	.....	.....	.....
Rocky Mountain	203.3	218.1	.....	.....	.....
Basin and Plateau	79.2	423.4	.....	.....	.....
Pacific	116.8	151.0	.....	.....	.....

The preceding table shows that during the first sixty years of the nineteenth century the increase in the population of continental United States for each twenty years was between six-eighths and seven-eighths of the initial number, that from 1860 to 1880 it was about five-eighths, and from 1880 to 1900 about one-half. In the North Central division, in each of its two parts, and in the Eastern South Central division the rate of growth declined continuously from the beginning to the end of the century. This is not true, however, of the Western South Central division or the Atlantic divisions. The rate of growth in the South Atlantic group and in each of its parts was higher in the twenty-year period, 1860 to 1880, than in either of the two preceding periods. This suggests that the retarding influences arising from the Civil War and from the natural tendency to a slower rate of growth as a region becomes thickly settled were more than counterbalanced by the stimulus to the growth of population resulting from the institution of a policy of freedom.

This inference is perhaps supported by noting that during the same twenty-year period—1860 to 1880—the growth in the Atlantic states north of Mason and Dixon's line, where the birth rate and immigration were reduced first by the Civil War and later by the long industrial depression of the seventies, was more sluggish than at any other period of the century.

For the purpose of comparing the growth of the Northern states—North Atlantic and North Central—with that of the Southern—South Atlantic and South Central—the following table has been prepared:

TABLE VII.—INCREASE OF POPULATION FOR NORTH AND SOUTH: 1790 TO 1900.

CENSUS.	POPULATION.		INCREASE OF POPULATION DURING—							
			Preceding ten years.				Preceding twenty years.

[1] Includes population of Indian Territory and Indian reservations.

[2] Excludes population of Indian Territory and Indian reservations.

The preceding table shows that during the ten years from 1790 to 1800 the rates of growth in the two sections (36.5 and 33.7 per cent) were not widely different; that during each of the six decades preceding the Civil War the growth of the North was more rapid, and the growth of the South less rapid, than during the first decade of the nation's history; that the maximum growth in the North and the minimum growth in the South before the Civil War occurred in the same decade, 1830 to 1840, when the decennial increase of the North (41.4 per cent) was nearly double that of the South (21.8 per cent); that in each decade previous to 1890, except that of 1870 to 1880, which was affected by the undercount of the former year, the Northern states grew more rapidly, and in most decades much more rapidly, than the Southern; and that, as appears from a comparison

of the rates for the last two decades, the growth in the Northern states is declining while that in the Southern is slightly increasing.

In order to get a briefer series of figures and to exclude all reference to the questionable returns of 1870, columns have been added giving the increase of the North and the South for each twenty-year period of the nineteenth century.

The last two columns in Table VII show that during the twenty years 1880 to 1900 the rates of growth in these two sections of the country have been practically identical; that in the South the growth was slightly more rapid for the period 1880 to 1900 than it was for the preceding period 1860 to 1880, while in the North it was much less rapid. During the three twenty-year periods prior to the Civil War the growth in the North was about one and one-half times as rapid as that in the South.

The more rapid growth of the Northern states in comparison with the Southern during the century from 1790 to 1890, and the reversal of relations during the last ten years, is vividly presented by the following figures, showing for each census the number of persons living in the Northern states to each 1,000 persons living in the Southern states:

1790	1,004	1860	1,769
1800	1,025	1870	2,057
1810	1,092	1880	1,930
1820	1,181	1890[1]	2,005
1830	1,253	1890[2]	1,988
1840	1,455	1900	1,932
1850	1,562		

In 1790 the population of the two regions was about the same; in 1860 the population of the North was greater than that of the South by three-fourths; in 1890 it was almost double. During the entire century from 1790 to 1890, allowing for the omissions in the South at the census of 1870, the Northern states increased more rapidly, while in the last ten years they have increased less rapidly, than the Southern.

Continental United States may be regarded also as divided into two main sections by the Mississippi river, the area east of that stream including the two Atlantic and the two eastern Central divisions, while west of it are the two western Central and the Western divisions. The following table shows the growth in these two regions during each decade of the country's history:

[1] Excludes population of Indian Territory and Indian reservations.

[2] Includes population of Indian Territory and Indian reservations.

TABLE VIII.—*Increase of population in continental United States east and west of the Mississippi river: 1790 to 1900.*

CENSUS.	POPULATION. East of the Mississippi river.	POPULATION. West of the Mississippi river.	INCREASE OF POPULATION. Number. East of the Mississippi river.	INCREASE OF POPULATION. Number. West of the Mississippi river.	INCREASE OF POPULATION. Per cent. East of the Mississippi river.	INCREASE OF POPULATION. Per cent. West of the Mississippi river.
1900	55,023,513	20,971,062	8,851,163	4,195,698	19.2	25.0
1890[1]	46,172,350	16,775,364				
1890[2]	46,160,075	16,462,175	7,263,652	5,202,815	18.7	46.2
1880	38,896,423	11,259,360	7,215,121	4,382,291	22.8	63.7
1870	31,681,302	6,877,069	1,774,456	2,340,594	17.7	51.6
1860	29,906,846	4,536,475	5,714,374	2,537,071	27.0	126.9
1850	21,192,472	1,999,404	5,005,918	1,122,605	30.9	128.0
1840[4]	16,186,554	876,799	3,712,434	490,217	29.8	126.8
1830[4]	12,474,120	386,582	3,069,933	152,316	32.6	65.0

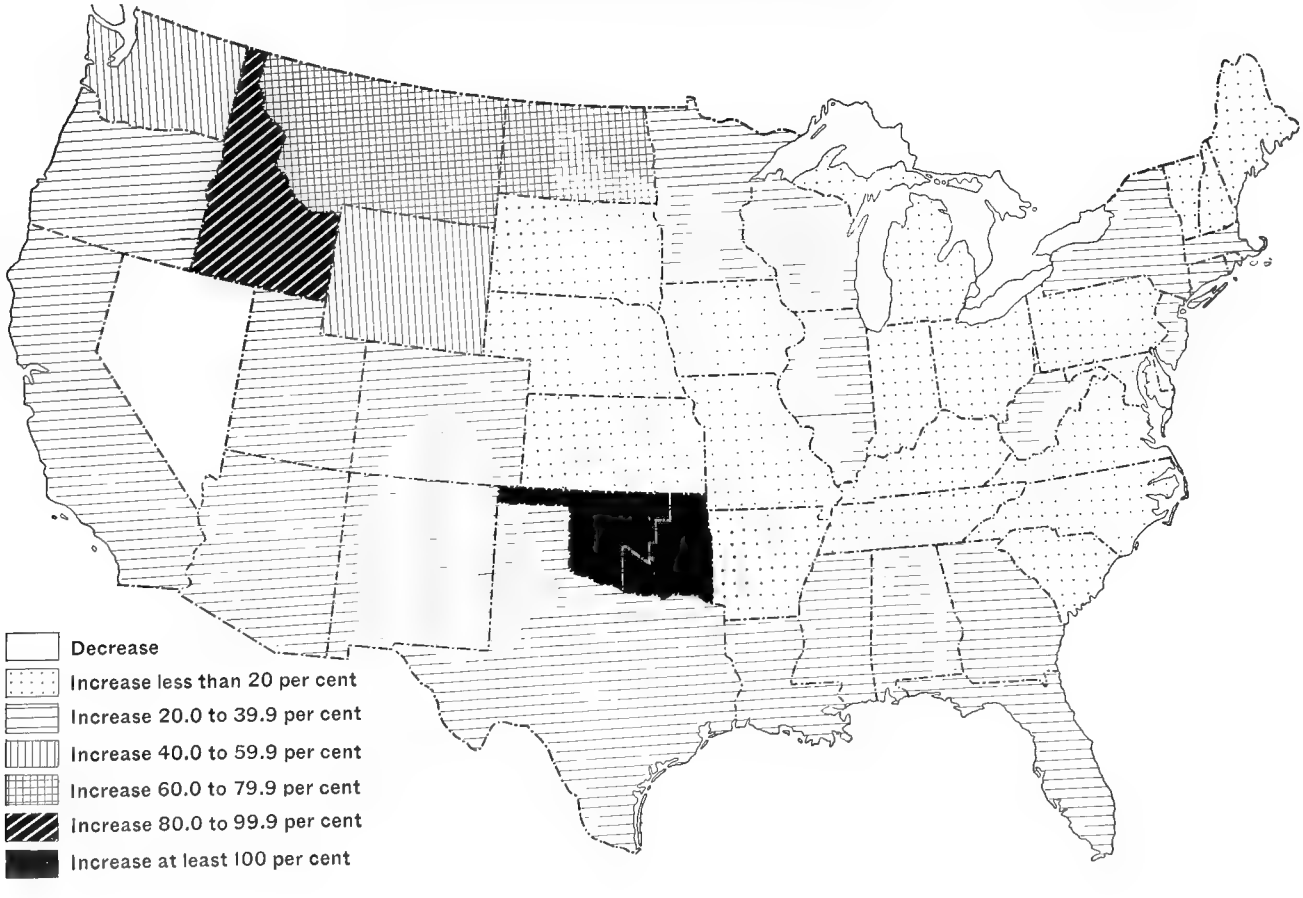
1810	7,142,480	97,401	1,833,997	97,401	34.5	
1800	5,308,483		1,379,269		35.1	
1790	3,929,214					

[1] Includes population of Indian Territory and Indian reservations.
[2] Excludes population of Indian Territory and Indian reservations.
[3] Excludes 6,100 persons on public ships in the service of the United States, not credited to any state or territory.
[4] Excludes 5,318 persons on public ships in the service of the United States, not credited to any state or territory.

The preceding table shows that during the last ten years the population west of the Mississippi river increased by one-fourth, while that east of it increased by nearly one-fifth. The difference in the present rates of growth of the two sections is comparatively slight, much less than at earlier periods in the country's history. Between 1860 and 1890 the region west of the Mississippi increased its population each ten years by about one-half; the region east of the Mississippi, by less than one-fourth. Table VIII shows also that the region east of the Mississippi increased more rapidly from 1890 to 1900 than from 1880 to 1890, while west of that river the growth suffered a sharp check in the last ten years. It shows, moreover, that the difference in rate of growth between the eastern and western parts of the United States is giving place to a more uniform and steady growth throughout the country.

States and territories.—In Table IX the states and territories of continental United States are arranged in the order of their rates of growth, 1890 to 1900, the per cent of increase for each being given. The figures from which these per cents are computed agree in the main with those in Twelfth Census, Volume I, Tables 1 and 2, the slight differences revealed by a careful comparison being due to adding the population of Indian Territory and of the Indian reservations in 1890 to the population reported by the general count and embodied in the tables of Volume I.

TABLE IX.—*States and territories arranged according to per cent of increase of population: 1890 to 1900.*



STATE OR TERRITORY.	Per cent of increase, 1890 to 1900.	STATE OR TERRITORY.	Per cent of increase, 1890 to 1900.
Oklahoma	407.6	District of Columbia	21.0
Indian Territory	117.6	Alabama	20.8
Idaho	82.7	Georgia	20.6
Montana	70.3	Mississippi	20.3
North Dakota	67.1	Pennsylvania	19.9
Wyoming	47.9	North Carolina	17.1
Washington	45.0	Iowa	16.7
Arizona	39.3	South Carolina	16.4
Texas	36.4	Arkansas	16.3
Florida	35.0	Missouri	16.0
Minnesota	33.7	Michigan	15.6
Utah	31.3	Kentucky	15.5
Colorado	30.6	South Dakota	15.2
New Jersey	30.4	Indiana	14.8
Oregon	30.2	Tennessee	14.3
Illinois	26.0	Maryland	14.0
West Virginia	25.7	Ohio	13.2
Massachusetts	25.3	Virginia	12.0
Rhode Island	21.0	Delaware	9.6
Louisiana	23.5	New Hampshire	9.3
California	22.4	Maine	5.0
Wisconsin	22.2	Vermont	3.4
New Mexico	21.9	Kansas	3.0
Connecticut	21.7	Nebraska	0.3
New York	21.1	Nevada	[1]10.6

[1] Decrease.

Map 6 shows the geographic distribution of the states having specified rates of increase or decrease, and may profitably be examined in connection with Table IX.

Nevada was the only state which lost population in the last decade. The region of moderate growth (or a growth of less than 20 per cent in ten years, which is not widely different from the class of states increasing less rapidly than the whole of continental United States, namely, 20.7 per cent) was the region extending from Pennsylvania to South Carolina, inclusive, and thence westward to South Dakota, Nebraska, and Kansas. Within this area the only states having a gain of more than 20 per cent were the District of Columbia, West Virginia, and Illinois. Outside of it the only states having a gain of less than 20 per cent were Michigan and the 3 northern states of New England. Along the southern boundary of continental United States there was comparative uniformity in rate of growth, every state and territory from Florida to California having an increase of between 20 and 40 per cent. Along the northern boundary the conditions were much more diverse, 6 states increasing less than 20 per cent, 3 from 20 to 40 per cent, 1 from 40 to 60 per cent, 2 from 60 to 80 per cent, and 1 from 80 to 100 per cent. Thus, 5 classes out of the 7 distinguished on Map 6 are represented along the northern boundary, and only 1 along the southern. The only 2 states and territories having what has been called a

MAP 6.—STATES AND TERRITORIES HAVING PER CENT OF INCREASE OR DECREASE OF POPULATION WITHIN SPECIFIED LIMITS: 1890 TO 1900.

frontier rate of growth, that is, an increase of more than 100 per cent, are Indian Territory and Oklahoma. Aside from these, the conspicuous regions of growth more rapid than that of the surrounding territory are the manufacturing and commercial states about New York harbor, the manufacturing state of West Virginia, the states of Illinois and Wisconsin, North Dakota, and the northern states of the Western division.

The growth in the population of the several states and territories during the last ten years is further illustrated by the following comparison, in which the states are arranged in two columns, the first column showing the order of population in 1890, and the second column the order of increase of population in the decade 1890 to 1900:

States and territories arranged according to population in 1890, and according to increase of population, 1890 to 1900.

In order of population, 1890.	In order of increase, 1890 to 1900.
1. New York.	1. New York.
2. Pennsylvania.	2. Pennsylvania.
3. Illinois.	3. Illinois.

49. Wyoming.	49. Nebraska.
50. Nevada.	50. Nevada.

If a state occupies the same position in the two columns, as do New York, Pennsylvania, Illinois, Mississippi, Rhode Island, and Nevada, it shows that during the last decade the state tended to retain the rank in order of population which it held in 1890. If a state stands higher in the second column than in the first, as do 23 states and territories, it shows that the state's increase tended to give it a higher rank in 1900 than it held in 1890. If a state occupies a lower position in the second column than in the first, as do 21 states and territories, it shows that the state's increase tended to give it a lower rank. Thus, for example, Ohio, ranking fourth in 1890, added fewer persons to its population in the following ten years than Texas or Massachusetts, which ranked below it; and Massachusetts added more to its numbers than Missouri or Ohio, which outranked it, but fewer than Texas, which it outranked.

The foregoing comparison has been supplemented by another (Table x), in which the per cent of increase for each state or territory from 1890 to 1900 is compared, not with the average for continental United States, but with the increase for the same state or territory from 1880 to 1890. As the population of Indian Territory was not enumerated prior to 1890, that territory, with Oklahoma, which was set off from it, is excluded from the table. Such comparison shows what regions of the country are and what are not maintaining their former rate of growth.

TABLE X.—*States and territories ranked according to change in per cent of increase of population.*

[1] Decrease. [2] Less than one-tenth of 1 per cent.

In Map 7 the same comparison is indicated in graphic form, showing, as a table can not do, the geographic relations of the facts.

Table x and Map 7 show that although the per cent of increase for continental United States from 1890 to 1900 was less than that from 1880 to 1890, yet a number of states increased in the later decade more rapidly than in the earlier. They include all those bordering upon the Atlantic coast or the Gulf of Mexico, except Massachusetts, Rhode Island, Delaware, Florida, and Texas; away from the coast the states belonging to this class number only 5, namely, Vermont, West Virginia, Kentucky, Indiana, and Illinois. But Nevada, with a decrease, 1890 to 1900, less rapid than that, 1880 to 1890, has been included in the same class. Along the Atlantic and Gulf coasts more than two-thirds (13 out of 19) of the states and territories improved on their previous rate of growth; in the interior and the West this was true of one-sixth (5 out of 29). Map 7 also makes more precise the inference already drawn from the figures for state groups, that the population east of the Mississippi river increased more rapidly, 1890 to 1900, than 1880 to 1890.

Table x shows, further, that the 2 states in which the rate of increase from 1890 to 1900 was most in excess of that from 1880 to 1890 were the 2 adjoining the lower Mississippi, namely, Louisiana and Mississippi; that the 14 states and territories in which the rates of growth, 1890 to 1900, declined most from the rates of the same states and territories, 1880 to 1890, all lay west of the Mississippi; and that the states east of the Mississippi, the growth of which declined most, were Michigan, Florida, the District of Columbia, and Wisconsin—the 4 which had the highest rate of growth, 1880 to 1890, among those east of the Mississippi river.

MAP 7.—STATES AND TERRITORIES HAVING A MORE RAPID INCREASE OR LESS RAPID DECREASE OF POPULATION 1890 TO 1900 THAN 1880 TO 1890.

Counties.—In the first volume of the Twelfth Census is a table[1] giving the increase or decrease of population in each county between 1890 and 1900. As indicated in the sentence preceding that table, the changes in county boundaries during the decade were disregarded. In the effort to obtain strictly comparable figures a table has been prepared distributing the population and increase of population among the counties or similar areas the boundaries of which remained unchanged during the decade. In most cases the figures of this table agree with those of the table in Volume I. But when two contiguous counties, A and B, changed their boundaries between 1890 and 1900 only by transferring a part of A to B, and the population both in 1890 and 1900 of the part transferred is unknown, the two counties have been treated as a single area the boundaries of which did not change during the decade. If either census reported separately the population of the part transferred, a correction has been introduced in the reported figures so as to obtain the population of two areas with identical boundaries at both dates. Under this method the total number of these county areas,[2] 1890 to 1900, is slightly less than the actual number of counties at either date. The number of areas obtained by this process is shown by the following table:

[1] Twelfth Census, Vol. I, Table xv, pages xxxviii–lvii.

[2] This phrase is employed in this section to denote areas, most of which are counties, and all of which had the same boundaries at the beginning and at the end of the period in question.

TABLE XI.—*Number of county areas: 1890 to 1900 and 1880 to 1890.*

[1] The 17 cities made independent since 1890 are included in counties in which geographically located.

From the preceding table it appears that the number of county areas, 1880 to 1890, was 2,578, or 92.4 per cent of the number of counties in 1890; and that the number, 1890 to 1900, was 2,741, or 96.1 per cent of the number of counties in 1900. Therefore the disturbing influence of changes in county boundaries was about half as potent between 1890 and 1900 as it was between 1880 and 1890. South Carolina is the only state east of the Mississippi in which there has been a marked readjustment of county lines since 1890.

As the population living on Indian reservations was not reported at all in 1880, and was not reported by counties in 1890, it is necessary to base all per cents of increase for counties on figures excluding the population on Indian reservations.

Of the counties in the United States the great majority increased in population, but not a few decreased. The rates of change lay between a decrease of 68.3 per cent for Stanton county, Kans., and an increase of 4,344.4 per cent for Castro county, Tex.—a statement which illustrates the danger of using per cents apart from the numbers to which they relate, for Castro county rose from 9 to 400 inhabitants. Per cents computed on so small a base have little other warrant than that they are called for by a system which in the great majority of cases rests on a population large enough to give a significant rate of change.

As the rate of growth in continental United States, 1890 to 1900, was 20.7 per cent, it might be supposed that if the number of county areas with each single per cent of increase were counted, the largest number would be found at or slightly below 21 per cent. In the following table the number of counties is given for each per cent of increase, 1890 to 1900, from a decrease of between 9 and 10 per cent to an increase of between 49 and 50 per cent:

TABLE XII.—*Number of county areas having specified per cent of increase or decrease of population for continental United States: 1890 to 1900.*

PER CENT OF INCREASE OR DECREASE OF POPULATION.	Number of counties.	PER CENT OF INCREASE OR DECREASE OF POPULATION.	Number of counties.
Decrease of—		Increase of—	
9.0 to 9.9	6	20.0 to 20.9	49
8.0 to 8.9	11	21.0 to 21.9	39
7.0 to 7.9	10	22.0 to 22.9	46

17.0 to 17.9	53	48.0 to 48.9	10
18.0 to 18.9	55	49.0 to 49.9	8
19.0 to 19.9	45		

The preceding table affords a good illustration of certain forms of average sometimes employed in census statistics. An average in the most general sense is "an intermediate value derived from a given set of quantities by a process such that, if all the quantities were equal, the derivative quantity would coincide with the given ones."[1] The possible number of such averages is infinite, but the number ordinarily employed for statistical purposes is very small. In the present case the average rate of increase in the population of a county, 1890 to 1900, might be deemed equal to the average rate of increase for the population as a whole, namely, 20.7 per cent. It might also be found by adding the rates of increase of the several counties, taking account of the algebraic signs and dividing the sum by the total number of counties; the average found in this way would be an increase of 32.0 per cent. The former of these averages is similar to the weighted average used in price statistics, the per cent of increase for each county being given a weight determined by the population of that county; the latter is an example of the ordinary arithmetic mean, each county, whatever its population, being given an equal weight in the series. Another convenient way of stating the average rate of increase would be to find the rate such that half of the counties would have a lower and half a higher rate; in the present case this average, technically known as the "median," would be an increase of 14.9 per cent. Table XII shows that the most probable rate of increase lies between 4 and 5 per cent; this last average is called the "mode." The following diagram has been constructed from the figures in Table XII to illustrate graphically these four averages:

DIAGRAM 2.—*Number of county areas having specified per cent of increase or decrease of population: 1890 to 1900.*

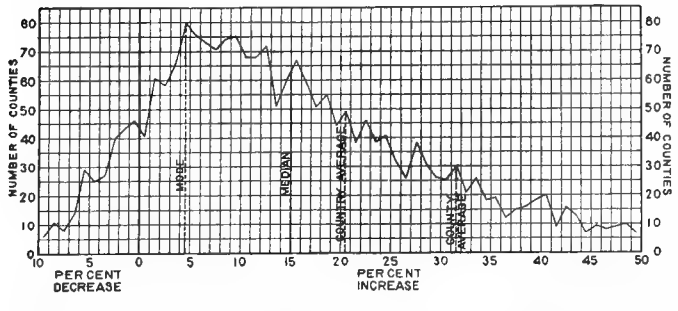

Diagram 2 illustrates somewhat more clearly than Table XII the fact that the number of county areas with specified per cent of increase or decrease rises rapidly from those with a decrease of 10 per cent to those with an increase of 5 per cent, and from that point descends somewhat uniformly, but more gradually, until the class with an increase of between 49 and 50 per cent is reached, at which point the number of counties is about the same as the number having a decrease of from 9 to 10 per cent.

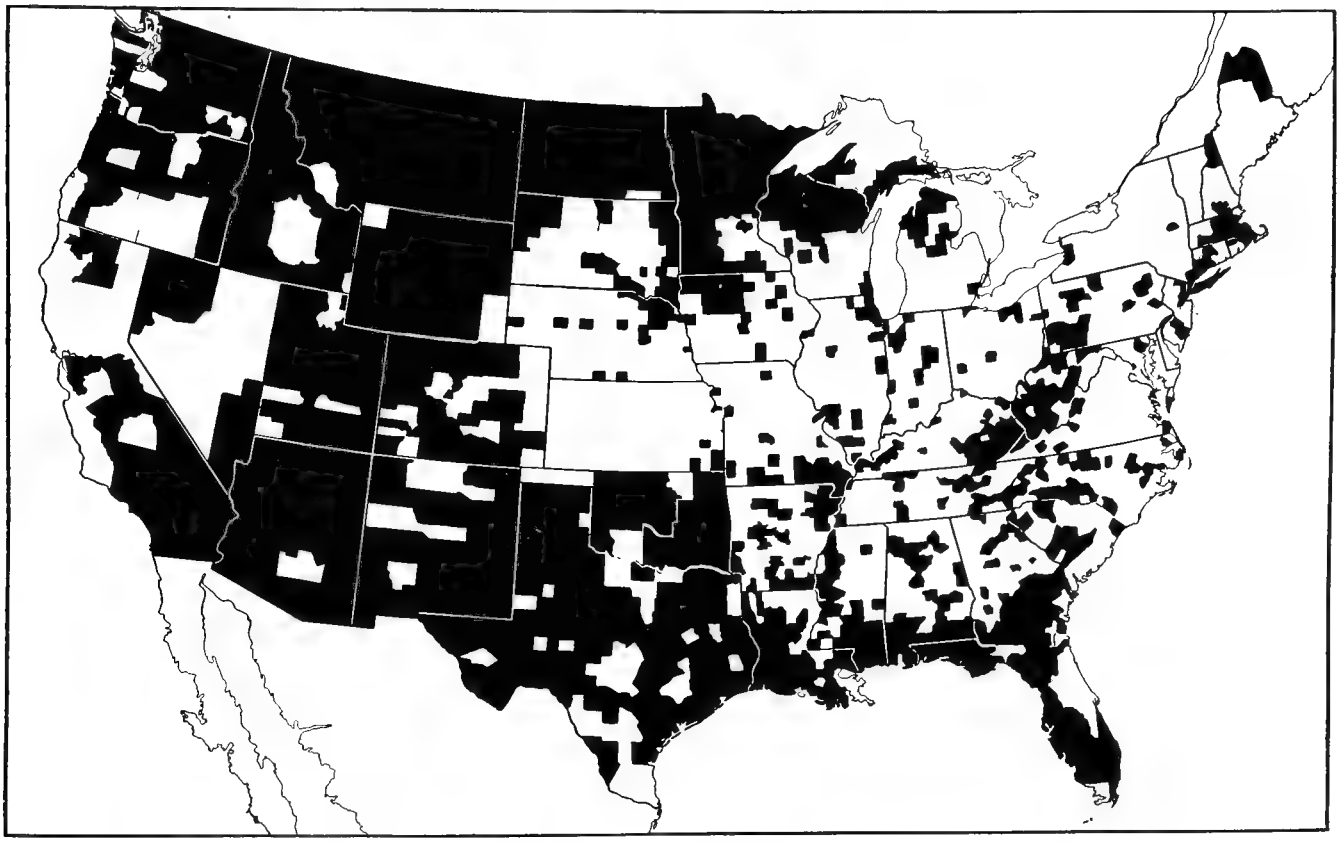
[1] F. Y. Edgeworth, article "Average," in Palgrave's Dictionary of Political Economy.

In the following table the county areas have been classified according to the rate of increase or decrease of population:

TABLE XIII.—*Number and land surface of county areas, classified by per cent of increase or decrease of population, for continental United States: 1890 to 1900.*

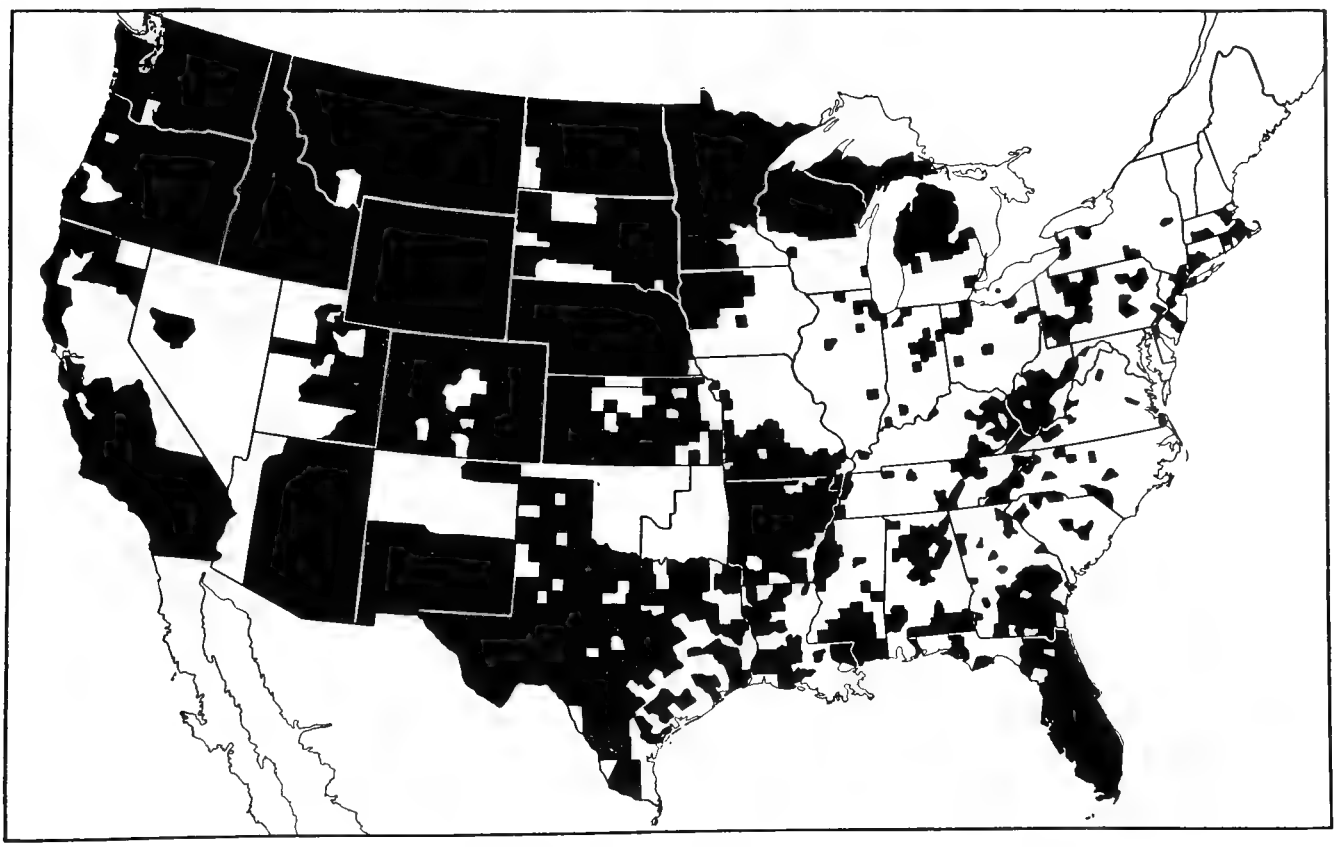
PER CENT OF INCREASE OR DECREASE OF POPULATION.	COUNTY AREAS.		
	Number.	Land surface in square miles.	Per cent of total land surface.
Total	2,741	2,970,230	100.0
Total decreasing	371	324,510	10.9
Decrease of—			
20.0 per cent and over	73	88,285	3.0
15.0 to 19.9 per cent	23	25,238	0.8
10.0 to 14.9 per cent	23	38,024	1.3
5.0 to 9.9 per cent	70	54,203	1.8
0.0 to 4.9 per cent	182	118,760	4.0
Total increasing	2,370	2,645,720	89.1
Increase of—			
0.0 to 4.9 per cent	307	225,821	7.6
5.0 to 9.9 per cent	371	262,860	8.9
10.0 to 14.9 per cent	324	244,125	8.2
15.0 to 19.9 per cent	282	186,361	6.3
20.0 to 24.9 per cent	214	224,111	7.5
25.0 to 29.9 per cent	155	162,918	5.5
30.0 to 34.9 per cent	122	204,827	6.9
35.0 to 39.9 per cent	86	89,958	3.0
40.0 to 44.9 per cent	68	129,677	4.4
45.0 to 49.9 per cent	46	52,157	1.8
50.0 to 99.9 per cent	233	422,942	14.2
100.0 per cent and over	162	439,963	14.8

In order to study the geographic distribution of the regions of rapid and slow growth, and of dwindling population, the county areas have been divided into three groups: (1) Those which grew faster than continental United States (24.9 per cent between 1880 and 1890 and 20.7 per cent between 1890 and 1900); (2) those which grew somewhat, but more slowly than continental United States; and (3) those which did not grow at all. The two maps on page 43 represent those counties which grew faster than the country as a whole, Map 8 being for the decade 1890 to 1900 and Map 9 for the decade 1880 to 1890.



From an examination of Map 8, for the decade 1890 to 1900, the following results appear:

1. The conspicuous areas of rapid growth lie mainly west of the Mississippi river.



2. East of the Mississippi the largest areas of rapid growth are found in the thinly settled regions of northern Wisconsin and Michigan, southern Mississippi, Alabama, and Georgia, and much of Florida. In these areas, as well as in northern Maine and New Hampshire, the growth of the lumbering industry has probably been an important factor in causing an increase of population.

3. A broken belt of rapidly growing counties may be traced from southwestern Pennsylvania, through West Virginia and Kentucky, into Tennessee. These are probably connected with the growth of mining and related industries.

MAP 8.—COUNTY AREAS HAVING A HIGHER PER CENT OF INCREASE OF POPULATION THAN CONTINENTAL UNITED STATES: 1890 TO 1900.

MAP 9.—COUNTY AREAS HAVING A HIGHER PER CENT OF INCREASE OF POPULATION THAN CONTINENTAL UNITED STATES: 1880 TO 1890.

4. A less extensive area of rapid growth appears in southeastern Missouri, northeastern Arkansas, and the Yazoo valley in Mississippi. Probably a part of this is connected with the reclamation of valuable agricultural lands through improvements in the levee system of the Mississippi river.

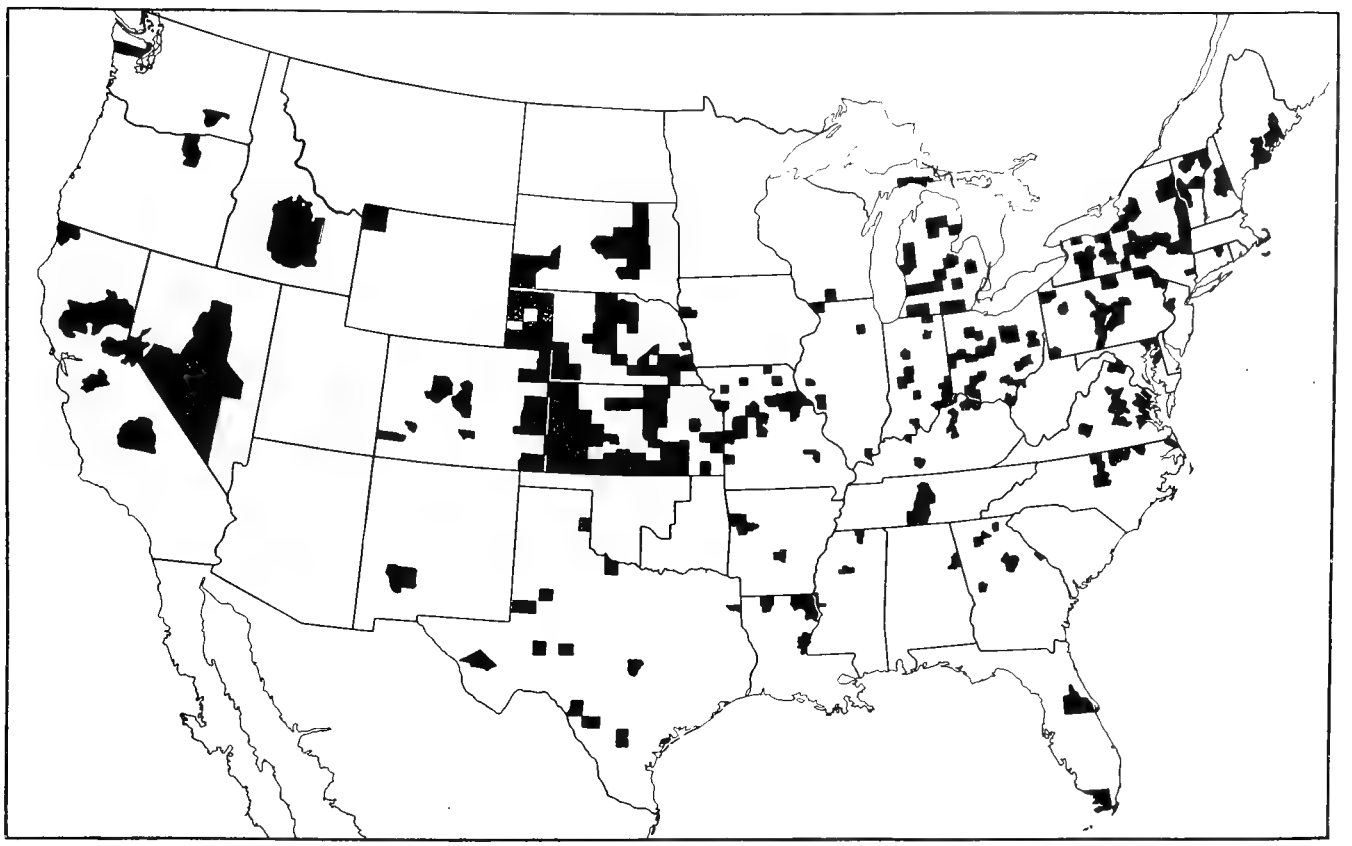
5. A cluster of rapidly growing counties appears at the head of Lake Michigan, about Chicago and Milwaukee, and small spots elsewhere mark the location of the large and prosperous lake ports of Detroit, Toledo, Cleveland, and Buffalo.

6. In the Southern states the areas of rapid growth are more extensive than they are in the North. The difference between the character of the increase in the North and in the South is indicated by comparing on the map individual Northern and Southern states which are shown by Table IX to have had substantially the same rate of growth. Thus, Illinois grew slightly faster than West Virginia or Louisiana, and New York slightly faster than Georgia or Alabama. But in New York state 6.7 per cent of the area increased more rapidly than the average for the country, while in Georgia the corresponding per cent was 41.3. From such comparisons it may be inferred that in the Northern states the growth has been localized in a few counties, mainly those containing large cities, while in the Southern states it has been distributed more evenly.

On Map 9, showing the counties which increased between 1880 and 1890 more rapidly than continental United States, Indian Territory and Oklahoma are left uncolored because there is no trustworthy information regarding their population in 1880. The great size of the counties in the Western division, and the lack of information regarding the population of Indian reservations, are other complicating elements to be borne in mind in interpreting this map for much of the area west of the Mississippi river.

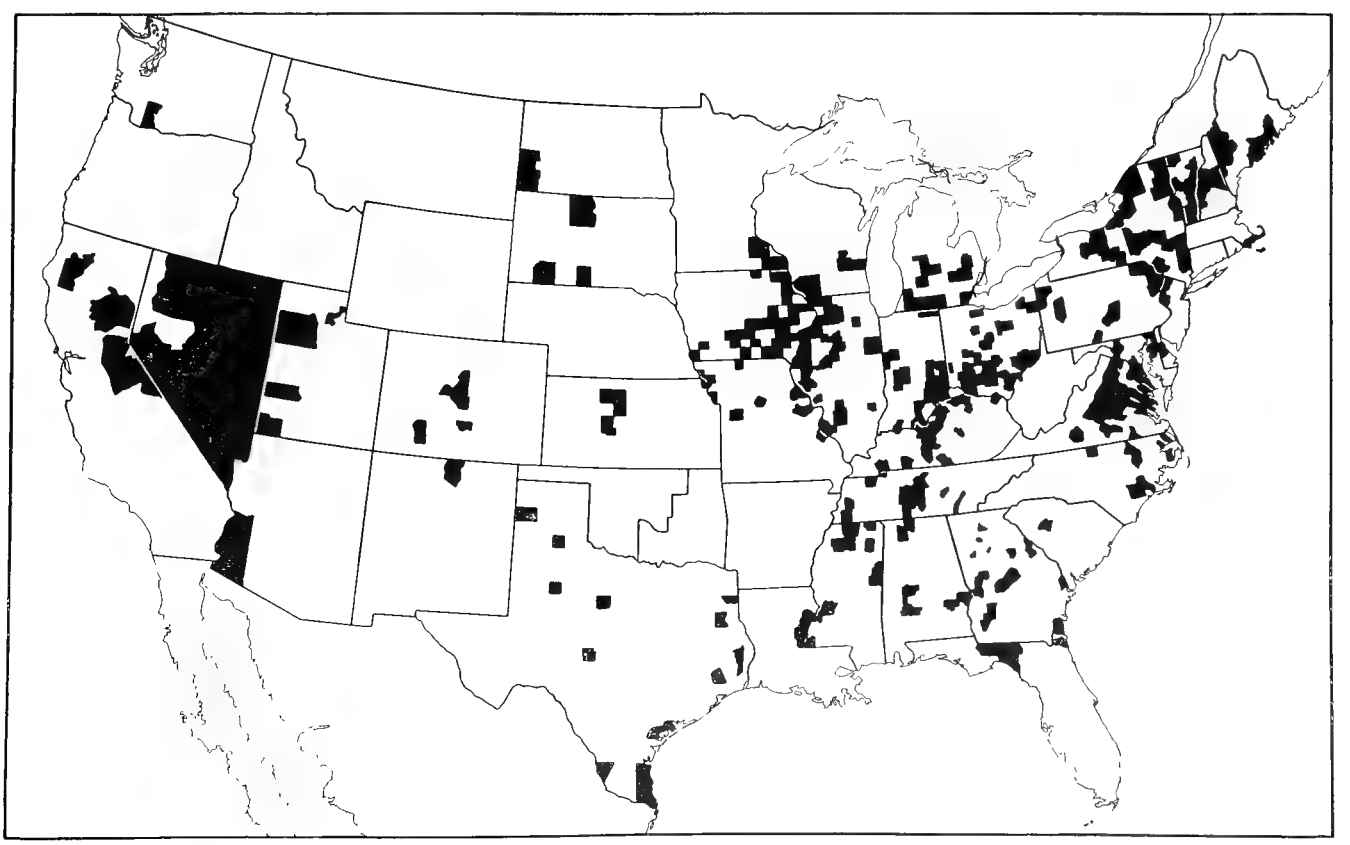
The first, third, and fifth inferences already drawn from Map 8 for the decade 1890 to 1900 hold true in general for the preceding ten years. The trans-Mississippi region of rapid growth then included nearly all of Nebraska and Arkansas, most of Kansas, and much of southern Missouri. A high rate of increase was characteristic of almost every county in the peninsula of Florida. The industrial region of northern Alabama was more definitely characterized by rapid growth. The increase in the lumbering regions of Michigan was more rapid than during the later decade. This change in Michigan, together with the more general increase between 1890 and 1900 in the regions along the Gulf of Mexico, may be due in part to a change in the localization of the lumber industry during the last ten years. The value of the lumber products of Michigan declined between 1890 and 1900; that of Georgia, Florida, Alabama, Mississippi, Louisiana, and Texas, though not greatly exceeding in 1900 that of Michigan alone in 1890, has almost doubled in the last ten years.[1]

Two similar maps, shown on page 45, indicate the county areas which declined in population at one or the other of the last two decades, Map 10 applying to the more recent period and Map 11 to that from 1880 to 1890.



From an examination of Map 10, showing the counties which lost population between 1890 and 1900, the following inferences may be derived:

1. In 12 states and territories—Rhode Island, Delaware, District of Columbia, West Virginia, South Carolina, Minnesota, North Dakota, Indian Territory, Oklahoma, Montana, Utah, and Arizona—every county increased in population.



2. The most conspicuous groups of adjoining counties which lost population, 1890 to 1900, are in the western and central parts of South Dakota, Nebraska, and Kansas, and the eastern part of Colorado. In those four states the counties losing population embraced more than one-third of the total area of all such counties in the country. The deficiency of rainfall and other available sources of water is doubtless the main reason for the decrease. The western parts of South Dakota, Nebraska, and Kansas suffered the most widespread loss and showed the heaviest per cent of decrease. The next largest group is in Nevada, where counties covering one-third of the area lost population. Closely connected with this region geographically are the 11 counties of California in the same class. The obstacles to agriculture and the decline of mining have probably cooperated in producing this result. There is a noteworthy number of similar counties in northern New England and in New York, Pennsylvania, Ohio, and Michigan. These counties lie mainly in regions where agriculture is not highly prosperous and the opportunities for other occupations are limited.

[1] Twelfth Census, Vol. IX, Table 4, pages 807–810.

MAP 10.—COUNTY AREAS HAVING A DECREASE OF POPULATION: 1890 TO 1900.

MAP 11.—COUNTY AREAS HAVING A DECREASE OF POPULATION: 1880 TO 1890.

3. The sharpest contrast between adjoining states is found in the Western North Central states. North Dakota and Minnesota had no counties, and Iowa had only one, which showed a decrease, while large areas of South Dakota, Nebraska, and Kansas lost population.

4. In the Northern states the relative area of counties decreasing in population was greater than in the Southern. This inference from the map is confirmed and made definite by the following figures, from which the Western group is omitted:

GROUP.	LAND SURFACE IN SQUARE MILES.		
	All county areas.	County areas losing population, 1890 to 1900.	Per cent of area losing population.
North Atlantic and North Central	915,653	178,481	19.5
South Atlantic and South Central	878,835	45,243	5.1

The figures show that in the Northern states nearly one-fifth of the area suffered a decrease in population; in the Southern states the proportion was little more than one-twentieth. This difference suggests that the substantial identity of the rates of growth in the two regions results from a relatively uniform growth over the whole South equalized by a balance in the North between a low rate of rural growth and a high rate of urban growth. If so, the fact may be interpreted as an illustration of the inference which foreign statisticians have sometimes drawn from European figures, that large cities in their growth tend to deplete the country districts.

5. The counties east of the Mississippi which lost population are seemingly no larger a proportion of the total area than those west of that river. This suggestion derived from the map is confirmed by the following figures:

GROUP.	LAND SURFACE IN SQUARE MILES.		
	All county areas.[1]	County areas losing population, 1890 to 1900.	Per cent of area losing population.
Continental United States	2,970,230	324,510	10.9
Region east of the Mississippi river	854,903	90,565	10.6
Region west of the Mississippi river	2,115,327	233,945	11.1

From Map 11, showing the counties which lost population between 1880 and 1890,[1] the following inferences may be derived:

1. In 10 states and territories—Rhode Island, Connecticut, District of Columbia, West Virginia, Nebraska, Arkansas, Montana, Idaho, Wyoming, and Oregon—every county increased in population.

[1]For Indian Territory and Oklahoma no information is available for the decade 1880 to 1890.

2. The most conspicuous group of adjoining counties which decreased in population embraces almost the entire state of Nevada, a part of eastern California, and three counties in western Utah. Other noteworthy areas are in eastern Virginia, northern New England, central New York, and the valleys of the upper Ohio and Mississippi rivers.

3. In the Southern states as a whole the growth was more evenly distributed than it was in the Northern. This inference from the map is made precise by the following figures:

GROUP.	LAND SURFACE IN SQUARE MILES.		
	All county areas.	County areas losing population, 1880 to 1890.	Per cent of area losing population.
North Atlantic and North Central	915,653	134,934	14.7
South Atlantic and South Central[1]	809,005	73,025	9.0

[1]Figures exclude Indian Territory and Oklahoma, as the population of those areas was not reported in 1880.

In the Northern states the counties which lost population embraced about one-seventh, and in the Southern states about one-eleventh, of the total area.

4. The areas east of the Mississippi river which lost population were seemingly a larger part of the total than the areas west of that river. This indication of the map is confirmed by the following figures:

GROUP.	LAND SURFACE IN SQUARE MILES.		
	All county areas.	County areas losing population, 1880 to 1890.	Per cent of area losing population.
Continental United States[1]	2,900,208	359,201	12.4
Region east of the Mississippi river	854,903	152,270	17.8
Region west of the Mississippi river[1]	2,045,305	206,931	10.1

[1]Figures exclude Indian Territory and Oklahoma, as the population of those areas was not reported in 1880.

East of the Mississippi the counties which showed no increase of population embraced over one-sixth, and west of that river about one-tenth, of the total area.

From a comparison of these two maps, or of the figures they interpret, certain further inferences arise:

1. The eye can not determine from the cuts whether a gain of population was more general, 1890 to 1900, or 1880 to 1890. But the figures show that 12.4 per cent of the area of the country as measured by county lines declined in population from 1880 to 1890, but only 10.9 per cent of the area was stationary or retrogressive in population from 1890 to 1900. As regards evenness of growth, the condition of the country was more prosperous from 1890 to 1900 than it was from 1880 to 1890.

2. Certain regions in which there was a loss of population during the earlier decade have been progressing since 1890. The most conspicuous illustration is found in parts of Nevada; other regions may be noticed in Arizona, Utah, eastern Virginia, the valley of the Ohio, the valley of the upper Mississippi, and northern New England. On the other hand, there are certain regions in which loss of population was more general during the later decade. The most conspicuous instance is found in the western parts of South Dakota, Nebraska, and Kansas, and in Idaho, but other illustrations appear in central Missouri and central Pennsylvania.

3. It is probable that the decrease of population in a large number of agricultural counties in western Illinois and eastern Iowa during the decade between 1880 and 1890 is closely connected with the very rapid growth, during that decade, in the agricultural areas just west of them, in South Dakota, Nebraska, and Kansas.[1] It is probable, also, that the loss of population during the last ten years in large areas of western and central Kansas, Nebraska, and South Dakota is closely connected with the rapid growth of the agricultural counties in the states just east of them, Iowa and Illinois, and also with the rapid progress of Oklahoma and Indian Territory, to the south. In the western parts of the subhumid states, which extend into the region of the Great plains, the conditions of recent years have not favored agriculture, and many persons who migrated to those regions from the prosperous agricultural districts of the east between 1880 and 1890 have turned back to the land from which they came, or southward to new fields. The birthplace tables published by the Census Office,[2] from which a comparison between the state or territory of birth and that of residence can be made, and which will be analyzed in a subsequent section, will throw some light upon this suggestion.

The inference from Maps 8 and 10 that in the North the growth of population is concentrated at relatively few points, but in the South is more evenly distributed, may be tested from the figures by grouping the county areas in accordance with their rates of increase, from 1890 to 1900. The following table expresses the results, the Western division being omitted:

[1] Map 9.
[2] Twelfth Census, Vol. I, pages cxxv–clxx.

TABLE XIV.—*Number and land surface of county areas, classified by per cent of increase or decrease of population, for North and South: 1890 to 1900.*

PER CENT OF INCREASE OR DECREASE OF POPULATION.	COUNTY AREAS. Number—		Area in square miles—		Per cent of total area—	
	In the North.	In the South.	In the North.	In the South.	In the North.	In the South.
Total	1,220	1,253	615,653	878,835	100.0	100.0

10.0 to 14.9 per cent...	16	3	13,380	1,145	1.5	0.1
5.0 to 9.9 per cent...	44	22	32,185	11,875	3.5	1.4
0.0 to 4.9 per cent...	119	54	72,403	22,894	7.9	2.6
Total increasing	977	1,165	737,172	833,547	80.5	94.8
Increase of—						
0.0 to 4.9 per cent...	189	105	136,152	52,700	14.9	6.0
5.0 to 9.9 per cent...	197	159	127,246	86,730	13.9	9.9
10.0 to 14.9 per cent...	142	161	93,789	99,454	10.2	11.3
15.0 to 19.9 per cent...	103	164	62,267	88,562	6.8	10.1
20.0 to 24.9 per cent...	66	120	47,292	70,811	5.2	8.1
25.0 to 29.9 per cent...	50	88	30,170	56,697	3.3	6.4
30.0 to 34.9 per cent...	39	60	29,518	42,450	3.2	4.8
35.0 to 39.9 per cent...	31	46	18,643	31,421	2.0	3.6
40.0 to 44.9 per cent...	24	33	17,385	24,525	1.9	2.8
45.0 to 49.9 per cent...	12	30	10,478	32,622	1.2	3.7
50.0 to 99.9 per cent...	89	105	81,849	121,499	8.9	13.8
100.0 per cent and over.	35	94	82,383	126,076	9.0	14.3

The extended table from which the preceding has been condensed reveals the fact that in the North the rates of growth shown by the largest number of counties are 3.0 to 3.9 per cent and 5.0 to 5.9 per cent, 45 counties falling into each class. In the South, on the contrary, the rate of growth shown by the largest number of counties is 15.0 to 15.9 per cent, 39 counties falling into that class.

Table XIV shows that the per cent of the area in each class under an increase of 10 per cent is noticeably greater in the North than in the South, while in every class of county areas with an increase over 10 per cent, the per cent for the South is greater than for the North. This table is made to agree with the statement that the two sections have now substantially identical rates of growth by the fact that in the North a number of counties falling into the higher classes are very populous, and exert far more than the average influence upon the total figures for that section.

More significant than the proportion of the land surface of the United States, subject to specified conditions of decrease or increase as shown in Table XIII, is the proportion of the population of the United States living under such conditions.

TABLE XV.—*Number and population of county areas, classified by per cent of increase or decrease of population, 1890 to 1900, for continental United States: 1900.*

PER CENT OF INCREASE OR DECREASE OF POPULATION.	COUNTY AREAS. Number.	Population.	Per cent of total population.
Total	2,741	75,994,575	100.0
Total decreasing	371	5,865,238	7.7
Decrease of—			
20.0 per cent and over	73	196,721	0.3
15.0 to 19.9 per cent	23	198,466	0.3
10.0 to 14.9 per cent	23	414,400	0.5
5.0 to 9.9 per cent	70	1,237,962	1.6
0.0 to 4.9 per cent	182	3,817,689	5.0
Total increasing	2,370	70,129,337	92.3
Increase of—			
0.0 to 4.9 per cent	307	7,159,118	9.4
5.0 to 9.9 per cent	371	8,732,085	11.5
10.0 to 14.9 per cent	324	8,502,062	11.2
15.0 to 19.9 per cent	282	8,790,277	11.6
20.0 to 24.9 per cent	214	7,856,313	10.3
25.0 to 29.9 per cent	155	5,719,671	7.5
30.0 to 34.9 per cent	122	5,898,947	7.8
35.0 to 39.9 per cent	86	4,771,471	6.3
40.0 to 44.9 per cent	68	3,275,825	4.3
45.0 to 49.9 per cent	46	1,065,510	1.4
50.0 to 99.9 per cent	233	6,623,158	8.7
100.0 per cent and over	162	1,734,900	2.3

The preceding table shows that one-thirteenth of the population of the United States are living in counties which declined in numbers between 1890 and 1900, while twelve-thirteenths are living in counties which increased. Of the counties which decreased, one-half, embracing two-thirds of the population, decreased less than 5 per cent; in other words, were substantially stationary in population. While the largest number of counties are found in the class increasing between 5 and 10 per cent, the largest per cent of the population is found living in counties which increased from 15 to 20 per cent. More than half the population of the United States (54.0 per cent) are living in counties which increased somewhat, but less than 25 per cent. Only 2.3 per cent of the population were living in counties which more than doubled in the last ten years, or under what has been defined as frontier conditions. Table XV has been supplemented by another confined to the North and South, and exclusive of the Western division, where county boundaries have been much changed in the last ten years.

TABLE XVI.—*Number and population of county areas, classified by per cent of increase or decrease of population, 1890 to 1900, for North and South: 1900.*

PER CENT OF INCREASE OR DECREASE OF POPULATION.	COUNTY AREAS. Number— In the North.	Number— In the South.	Population— In the North.	Population— In the South.	Per cent of total population— In the North.	Per cent of total population— In the South.

100.0 per cent and over	35	94	300,379	999,023	0.6	4.1

[1] Less than one-tenth of 1 per cent.

About one-tenth of the population of the North lives in county areas which decreased during the last ten years, while only about one-twentieth of the population of the South lives in such areas. The per cent columns show a higher proportion for the North in each class under an increase of 10 per cent, a higher proportion for the South in each class from 10.0 to 24.9, and a higher proportion for the North again in each class from 25.0 to 44.9. A large proportion increasing over 100 per cent is shown for the South, but two-thirds of this population is in Indian Territory and Oklahoma. The large proportion of the population of the South increasing from 10 to 25 per cent 43.7 per cent for the South against 27.7 per cent for the North —and the high per cents for the North below and above these limits substantiate the point already made that the growth of the South is the more even.

Physiographic divisions. As already explained in the section on area, pages 11 to 14, and as shown on Map 2, continental United States has been divided into 19 physiographic divisions.

TABLE XVII.—INCREASE OF POPULATION, FOR PHYSIOGRAPHIC DIVISIONS: 1890 TO 1900 AND 1880 TO 1890.

DIVISION.	POPULATION.				INCREASE OF POPULATION.			
					Number.		Per cent.	
	1900	1890[1]	1890[2]	1880	1890 to 1900	1880 to 1890	1890 to 1900	1880 to 1890

[1] Includes population of Indian Territory and Indian reservations. [2] Excludes population of Indian Territory and Indian reservations.

Table XVII gives the population of these 19 divisions at the censuses of 1900, 1890, and 1880, and the increase during each of the two decades.

The table shows that during the later decade growth was most rapid in the Columbian mesas, including large portions of Idaho, Washington, and Oregon, and that it was slowest in the Interior timbered region, lying mainly in Ohio, Indiana, Kentucky, and Tennessee, where it was little more than one-half the average for the country.

In the decade 1880 to 1890, when the Great plains, the Columbian mesas, and the Plateau region were under frontier conditions, as already defined—that is, conditions such that the population more than doubled in ten years—the differences between the various physiographic divisions were far more marked than they were in the last ten years. Thus, in the decade 1880 to 1890, the Great plains increased in population (220.4 per cent) over twenty times as fast as the Interior timbered region (10.4 per cent), while in the decade 1890 to 1900, the Columbian mesas increased (50.5 per cent) less than five times as fast as the Interior timbered region (11.5 per cent), the difference between the extremes, 1890 to 1900, being only about one-fifth of what it was, 1880 to 1890.

Of the 19 physiographic divisions 5 increased more rapidly, 1890 to 1900, than they did, 1880 to 1890. These lie mainly east of the Mississippi river, and include all physiographic divisions entirely in that region except the Appalachian valley and the Allegheny plateau.

City and country.—The ordinary definition of city is "an incorporated municipality." But the United States contains many such municipalities having less than 100 inhabitants and devoid of all urban characteristics; hence, for census purposes at least, this definition must be modified. The uniform method of modification is to add to the definition a minimum limit of population. What that limit should be is somewhat a matter of judgment; for the purposes of this report it has been drawn at 2,500. Furthermore, since in New England places as small as that are seldom incorporated, it is necessary to count as cities, also, all New England towns having at least 2,500 inhabitants and not containing an incorporated place.

How do the rates of growth for city and country compare? This question is answered by the following table:

TABLE XVIII.—POPULATION OF CITIES HAVING AT LEAST 2,500 INHABITANTS, AND OF COUNTRY DISTRICTS: 1900, 1890, AND 1880.

	POPULATION.				PER CENT OF TOTAL POPULATION.			PER CENT OF INCREASE.	
	1900	1890[1]	1890[2]	1880	1900	1890	1880	1890 to 1900	1880 to 1890
Continental United States	75,994,575	62,947,714	62,622,250	50,155,783	100.0	100.0	100.0	20.7	24.9
Cities having at least 2,500 inhabitants	30,583,411	22,559,367	22,559,367	14,670,866	40.2	35.8	29.3	35.6	53.8
Country districts	45,411,164	40,388,347	40,062,883	35,484,917	59.8	64.2	70.7	12.4	12.9

[1] Includes population of Indian Territory and Indian reservations. [2] Excludes population of Indian Territory and Indian reservations.

The preceding table shows that in twenty years the proportion of population living in cities has increased from three-tenths to four-tenths, the proportion living in the country having correspondingly declined. But it shows, also, that while the rate of growth of the country districts has remained substantially the same, the growth of cities, resulting from increase of number and extension of boundaries, as well as from additions to the population on the same area, has declined, being more than four times as rapid as that of country districts in the first decade and less than three times as rapid in the second. Thus, a marked tendency toward equality, such as has already been noted in a comparison of the rates of growth of North and South and of East and West, is apparent also in the rates of growth of city and country. The number of cities, as here defined, was 1,088 in 1880, 1,490 in 1890, and 1,861 in 1900—an increase of 402 in the earlier decade and 371 in the later. Probably some of this increase in number was due to greater accuracy in the separate reporting of small cities in 1890 and 1900 as compared with 1880, and it is unsafe, therefore, to infer that the number as well as the population of cities is increasing less rapidly than heretofore.

Is this tendency toward equality in the rates of growth of city and country affected by the population limit assumed to separate the two? The inference from Table XVIII is so unexpected and so important that the following tables have been prepared to show the results obtained when the limit between city and country is drawn at 4,000 and at 8,000, instead of at 2,500. The figures for 1890 and 1880 differ slightly from those in Twelfth Census, Volume I, Tables XXVIII, XXX, and XXXI, owing to differences in classification of certain cities of Connecticut in 1890, and of certain cities of New England, New York, and the District of Columbia in 1880.

TABLE XIX.—POPULATION OF CITIES HAVING AT LEAST 4,000 INHABITANTS, AND OF COUNTRY DISTRICTS: 1900, 1890, AND 1880.

	POPULATION.				PER CENT OF TOTAL POPULATION.			PER CENT OF INCREASE.	
	1900	1890[1]	1890[2]	1880	1900	1890	1880	1890 to 1900	1880 to 1890
Continental United States	75,994,575	62,947,714	62,622,250	50,155,783	100.0	100.0	100.0	20.7	24.9
Cities having at least 4,000 inhabitants	28,372,392	20,693,924	20,693,924	13,184,902	37.3	32.9	26.3	37.1	57.0
Country districts	47,622,183	42,253,790	41,928,326	36,970,881	62.7	67.1	73.7	12.7	13.4

[1] Includes population of Indian Territory and Indian reservations. [2] Excludes population of Indian Territory and Indian reservations.

TABLE XX.—POPULATION OF CITIES HAVING AT LEAST 8,000 INHABITANTS, AND OF COUNTRY DISTRICTS: 1900, 1890, AND 1880.

	POPULATION.				PER CENT OF TOTAL POPULATION.			PER CENT OF INCREASE.	
	1900	1890[1]	1890[2]	1880	1900	1890	1880	1890 to 1900	1880 to 1890
Continental United States	75,994,575	62,947,714	62,622,250	50,155,783	100.0	100.0	100.0	20.7	24.9
Cities having at least 8,000 inhabitants	24,992,199	18,244,625	18,244,625	11,388,661	32.9	29.0	22.7	37.0	60.2
Country districts	51,002,376	44,703,089	44,377,625	38,767,122	67.1	71.0	77.3	14.1	14.5

[1] Includes population of Indian Territory and Indian reservations. [2] Excludes population of Indian Territory and Indian reservations.

The above comparison shows that the evidence for the generalization, already made, that the rates of growth for city and country are approximating, is no less convincing when the line separating city and country is drawn at these higher limits of population; the rate of growth of country districts, as thus defined, still remains practically stationary, while the rate of growth of cities, especially those of over 8,000 inhabitants, is sharply checked.

Of cities having at least 4,000 inhabitants, there were 615 in 1880, 892 in 1890, and 1,157 in 1900, an increase of 277 in the earlier decade and 265 in the later. Of cities having at least 8,000 inhabitants, there were 287 in 1880, 445 in 1890, and 545 in 1900, an increase of 158 in the earlier decade and only 100 in the later. These figures show that the increase in the number, as well as in the population, of cities above these limits of size is less rapid than formerly, and confirms the

inference already suggested as possible, namely, that the number of cities having at least 2,500 inhabitants increased more slowly 1890 to 1900 than 1880 to 1890.

Does the tendency toward equality in the rates of growth of city and country appear in all the main and minor geographic divisions of the United States? The per cents of increase which furnish the answer to this question are given in the following table:[1]

TABLE XXI.—*Per cent of increase of population in cities having at least 2,500 inhabitants and in country districts: 1890 to 1900 and 1880 to 1890.*

DIVISION.	PER CENT OF INCREASE OF POPULATION.					
	1890 to 1900			1880 to 1890

[1] Decrease.

The preceding table shows that in every one of the five main divisions the per cent of increase of urban population during the last decade was less, and in every one but the North Atlantic, much less than between 1880 and 1890. On the contrary, in the two southern divisions the increase of rural population was noticeably greater, 1890 to 1900, than it was 1880 to 1890. In the North Atlantic division the rural districts as a whole were substantially stationary in each decade.

The table shows also that in each main division the difference in rate of increase between the urban and the rural population was less, and in every one, except the North Atlantic, much less, 1890 to 1900, than during the preceding ten-year period. It shows, further, that in the last ten years the cities of the North Atlantic division increased more rapidly than those of the South Atlantic, while the growth of the country districts was far more rapid in the South Atlantic states than in the North Atlantic. Both these facts corroborate inferences drawn from preceding tables. The difference between the rates of urban growth in the two Central divisions, 1890 to 1900 (5.3 per cent), is very much less than that between the rates of rural growth (15.6 per cent). In each of the 11 minor divisions of continental United States the difference between the per cents of increase of population in city and country, 1890 to 1900, was less than it was, 1880 to 1890. In the Southern North Atlantic division, which includes two of the three largest cities of the country, the decline is insignificant, only 0.5; in New England it is 6.9; in each of the remaining minor divisions the difference between the rates of growth of city and country, 1890 to 1900, was about one-third of the difference, 1880 to 1890. In every one of the 11 divisions the rate of growth of cities has fallen rapidly; on the contrary, in six of them the rate of growth of the country districts has risen, and in the one where the rural population declined, the decline in the last ten years was less than in the preceding period.

The cities of the United States (meaning, as already explained, all incorporated places having at least 2,500 inhabitants, and in New England all towns having at least 2,500 inhabitants and not containing an incorporated place) have been grouped for the last three censuses into five classes according to population. The following table gives the number of cities in each class and the per cent of the population living in them:

[1] For the figures on which these per cents are based, see Tables XLI, XLII, and XLIII.

TABLE XXII.—NUMBER AND POPULATION OF CITIES CLASSIFIED BY SIZE, AND POPULATION OF COUNTRY DISTRICTS: 1900, 1890, AND 1880.

	NUMBER OF CITIES.			POPULATION.				PER CENT OF TOTAL POPULATION.			PER CENT OF INCREASE OF POPULATION.	
	1900	1890	1880	1900	1890[1]	1890[2]	1880	1900	1890[1]	1880	1890 to 1900	1880 to 1890
Continental United States				75,994,575	62,947,714	62,622,250	50,155,783	100.0	100.0	100.0	20.7	24.9
All cities	1,861	1,490	1,088	30,583,411	22,559,367	22,559,367	14,670,866	40.2	35.8	29.3	35.6	53.8
Cities having a population of—												
100,000 and over	38	28	20	14,208,347	9,697,960	9,697,960	6,241,240	18.7	15.4	12.4	46.5	55.4
25,000 to 100,000	122	96	57	5,509,965	4,291,608	4,291,608	2,394,284	7.3	6.8	4.8	28.4	79.2
8,000 to 25,000	385	321	210	5,273,887	4,255,057	4,255,057	2,753,137	6.9	6.7	5.5	23.9	54.6
4,000 to 8,000	612	447	328	3,380,193	2,449,299	2,449,299	1,796,241	4.4	3.9	3.6	38.0	36.4
2,500 to 4,000	704	598	473	2,211,019	1,865,443	1,865,443	1,485,964	2.9	3.0	3.0	18.5	25.5
Country districts				45,411,164	40,388,347	40,062,883	35,484,917	59.8	64.2	70.7	12.4	12.9

[1] Includes population of Indian Territory and Indian reservations.

[2] Excludes population of Indian Territory and Indian reservations.

The preceding table shows that both the total number of cities in each class and the population living in those cities increased during each ten-year period. Except in the class of smallest cities, namely, those of 2,500 to 4,000 inhabitants, the growth of which kept even pace with the growth of the whole country, the proportion of the total population living in each class of cities increased in each decade, while the country districts, although adding about five millions to their population in each ten years, steadily lost ground relatively to the cities, which added about eight millions in each decade. For all cities and for each class, except that of 4,000 to 8,000 inhabitants, the rate of growth was very much less in the second decade than in the first; in the class excepted, the rate of growth in the two decades was about the same, an equality doubtless due in large measure to the fact that the number of such cities increased in the first decade 119 and in the second 165, the greater increase in number about offsetting the decline in average rate of growth. The most marked decline in rate of growth is found among the cities of 25,000 to 100,000 inhabitants, this also being due in large degree to the difference in the number of cities added, the increase being 39 in the first decade and only 26 in the second.

The decrease in the rate of growth in the population of cities is probably connected with the industrial depression of 1893 and the following years, a depression more serious and lasting and probably more influential in retarding the growth of urban population than any between 1880 and 1890. Another writer[1] has called attention to the fact that in the United States, urban population seems to have increased with a rhythmical or wave-like movement, rising and falling in successive decades, while the rural districts have increased much more steadily. This is shown by the following table:[2]

TABLE XXIII.—*Per cent of increase of population in cities having at least 8,000 inhabitants, and in country districts: 1790 to 1900.*

DECADE.	PER CENT OF INCREASE OF POPULATION—		Ratio of per cent of increase in cities to that in country districts.
	In cities.	In country districts.	
1890 to 1900	37.0	14.1	2.6
1880 to 1890	60.2	14.5	4.2
1870 to 1880	41.1	27.2	1.5
1860 to 1870	59.1	15.6	3.8
1850 to 1860	75.1	29.9	2.5
1840 to 1850	99.3	30.0	3.3
1830 to 1840	68.2	30.1	2.3
1820 to 1830	82.0	31.0	2.6
1810 to 1820	33.1	33.1	1.0
1800 to 1810	69.3	35.0	2.0
1790 to 1800	60.4	34.2	1.8

The preceding table shows that the rate of growth of urban population in the United States was at a maximum about the middle of the century, namely, 1840 to 1850. During the seven decades from 1790 to 1860 the rate rose and fell in regular succession. From 1840 to 1880 the growth steadily declined. From 1870 to 1900 there was a reappearance of the alternate rise and fall.

The rate of growth of rural population, on the contrary, slowly but steadily declined from 1800 to 1870, and if the per cents vitiated by the undercount in 1870, which especially affected the Southern states, and so especially the rural population, be disregarded, one may say that there was probably a steady decline in the rate of growth of rural population from 1800 to 1900, although between 1800 and 1860 it was relatively insignificant. During the last two decades the rate of growth in the rural districts has been approximately the same, and less than half of that which prevailed during the first seventy years of the national history. The last column shows that when the rates of growth of the urban districts are compared with the contemporaneous rates of growth of the rural districts a recurrent rise and fall is manifested throughout the eleven decades. It appears, therefore, that instead of a persistent tendency to decline throughout the one hundred and ten years, such as is apparent in the figures for the rural districts, the growth of cities has shown a periodic ebb and flow. The causes must be many and complex, but as they can not be detected or measured by statistical analysis of the material in hand they do not fall within the scope of the present discussion.

In Table XXIV the information presented in Table XXII for continental United States is presented for the five main geographic divisions.

In 22 out of the 25 cases the number of cities increased during each decade; in the other 3 cases it remained stationary in one or both decades.

The cities having at least 100,000 inhabitants in each of the two northern divisions increased in population at each decade much more rapidly than the entire division. In neither of the two southern groups is this true of both decades. In the South Atlantic division the two cities having at least 100,000 inhabitants, Baltimore and Washington, increased between 1890 and 1900 at a rate nearly the same as the average for the entire division (18.5 per cent for the cities, as compared with 17.9 per cent for the division as a whole), so that the proportion of the population of the division living in those cities was the same in 1900 as in 1890. In the South Central division the two cities having at least 100,000 inhabitants in 1880 and 1890, Louisville and New Orleans, increased during the intervening decade 18.6 per cent, while the division containing them increased 23.0 per cent, so that the proportion of the population of the division living in these cities slightly declined. In the South Atlantic, North Central, and Western divisions the increase of population in cities having at least 100,000 inhabitants was much less rapid in the second decade than in the first. In the North Atlantic and South Central divisions the reverse was true.

[1] Includes population of Indian Territory and Indian reservations.

[2] Excludes population of Indian Territory and Indian reservations.

The proportion of the population living in the class of cities having from 25,000 to 100,000 inhabitants shows an increase in every division at each decade, indicating that this class has been steadily gaining ground relative to the entire division. This results from additions to the number of such cities as well as from a rapid increase in the population of the original number. In each division, however, the population in this class of cities increased less than half as rapidly in the second decade as it did in the first.

The cities having between 8,000 and 25,000 inhabitants in the South Central and Western divisions lost ground relative to the entire population during the second decade; in the North Atlantic division they just held their own. The cities of 4,000 to 8,000 inhabitants showed a gain relative to the entire population in every division and for each decade, except in the North Atlantic division for the decade 1880 to 1890. But the cities of 2,500 to 4,000 inhabitants lost ground in the North Atlantic division during both decades, in the North Central and Western during the first decade, and in the South Atlantic during the second decade.

The increase of urban and rural population, and of the several classes of urban population, has been inves-

tigated by another method, in which the class to which each city is to be assigned is determined once for all by its population at the date of the last census. Under this method the cities and towns falling into a given class are the same at all censuses considered, and thus the disturbing influence of the passage of cities from one class to another during the period is removed. But the disturbing influence of annexations of territory is not removed; and in the case of New York city, the disturbance caused by the annexations between 1890 and 1900 is so great that it has been deemed wise to depart from the general rule. Accordingly, in the following tables the population of New York city in 1890 and 1880 has been taken from estimates made by the Census Office, showing, for each census from 1790 to 1890, the probable population of the area included within the present boundaries of the city.[1]

Another element which interferes slightly with the accuracy of the following tables is the appearance of various places in the reports of the census of 1890 or 1900, the population of which was not separately returned at earlier censuses. These places are all small, and the error introduced into the comparison through the unavoidable omission of their population at the earlier censuses is slight, merely tending to exaggerate a little the rate of growth in the groups of smaller cities.

[1] Twelfth Census, Vol. I, page lxxx.

TABLE XXV.—INCREASE OF POPULATION IN CITIES CLASSIFIED BY SIZE IN 1900: 1890 TO 1900 AND 1880 TO 1890.

LIMITS OF POPULATION IN 1900.	Number of cities.	POPULATION.				INCREASE OF POPULATION.			
						Number.		Per cent.	
		1900	1890[1]	1890[2]	1880	1890 to 1900	1880 to 1890	1890 to 1900	1880 to 1890

[1] Includes population of Indian Territory and Indian reservations.

[2] Excludes population of Indian Territory and Indian reservations.

The preceding table shows that in 1900 the population living in all cities, and in each class of cities, was about twice that living in the same cities in 1880, and that the population living in the country districts in 1900 was about one-third greater than the rural population in 1880. The per cents in the last two columns show that between 1880 and 1890 the rates of increase in the several classes of cities differed not a little, the cities having 25,000 to 100,000 inhabitants increasing by nearly three-fifths, while the largest and the smallest cities increased much more slowly. Between 1890 and 1900, on the contrary, the difference in the rates of increase of the several classes of cities was relatively insignificant, what difference there was being in favor of the smallest cities. The rate of increase of all cities, and of each separate class of cities, was notably less, 1890 to 1900, than 1880 to 1890, but the per cent of increase in the country districts at the two decades was substantially the same.

In the following table the facts which were given in Table XXV for continental United States are given for the five main geographic divisions:

TABLE XXVI.—INCREASE OF POPULATION IN CITIES CLASSIFIED BY SIZE IN 1900, FOR MAIN GEOGRAPHIC DIVISIONS: 1890 TO 1900 AND 1880 TO 1890.

[1] Includes population of Indian Territory and Indian reservations.

[2] Excludes population of Indian Territory and Indian reservations.

Comparing the two decades, it appears that the rate of increase for cities was almost uniformly less from 1890 to 1900 than from 1880 to 1890, the only exceptions being a slight advance in the group of cities having 2,500 to 4,000 inhabitants for the North Atlantic division, and in those having at least 100,000 for the South Central. In the country districts, on the contrary, the rate of increase in the North Atlantic, South Atlantic, and South Central divisions was higher between 1890 and 1900 than between 1880 and 1890; in the North Central and Western divisions it was lower.

It will be noticed that in the Atlantic and Central divisions the rate of growth, 1890 to 1900, of all cities together is not very far from the same, the range being between 25.6 per cent for the South Atlantic group and 34.1 per cent for the South Central. In the Western division it was 40.8 per cent. In country districts the rate of growth differs far more widely, ranging from 2.3 per cent for the North Atlantic division to 26.4 per cent for the Western. In the Northern states large cities have a higher rate of increase than in the Southern or Western. For cities having at least 100,000 inhabitants in 1900 the rate of growth during the past ten years is highest in the North Central group, where the 14 cities had an average increase of 37.9 per cent, and lowest in the South Atlantic group, where the 2 cities had an average increase of 18.5 per cent. Among cities having from 25,000 to 100,000 inhabitants in 1900 the rate of growth is highest in the Western division, where the 9 cities had an average increase of 51.2 per cent, and lowest in the South Atlantic division, where the 9 cities had an average increase of 20.7 per cent. Among cities having in 1900 from 8,000 to 25,000 inhabitants, as among those of the class last named, the

increase has been most rapid in the Western division (45.3 per cent) and least rapid in the South Atlantic (28.5 per cent). Among cities having 4,000 to 8,000 inhabitants in 1900 the most rapid growth is found, as in the two preceding classes, in the Western division (64.7 per cent), and the least rapid in the North Central (28.7 per cent).

In the following table similar facts are presented for the minor geographic divisions:

TABLE XXVII.—INCREASE OF POPULATION IN CITIES CLASSIFIED BY SIZE IN 1900, FOR MINOR GEOGRAPHIC DIVISIONS: 1890 TO 1900 AND 1880 TO 1890.

[1] Includes population of Indian Territory and Indian reservations.

[2] Excludes population of Indian Territory and Indian reservations.

The rate of growth during the decade 1890 to 1900 of all cities in the 11 minor geographic divisions ranged from 21.1 per cent for the Northern South Atlantic group to 49.8 per cent for the Rocky Mountain division.

There was a close parallelism as regards rates of growth between the Northern South Atlantic and Western North Central divisions, the per cent of growth of all cities together in the two divisions being 21.1 and 22.4, respectively, and that of country districts 13.3 and 13.4. In the Northern South Atlantic division the cities of over 25,000 inhabitants have grown more slowly, but those of 4,000 to 25,000 inhabitants more rapidly, than cities of the same size in the Western North Central.

In every one of the 11 minor divisions the growth of cities was less rapid from 1890 to 1900 than from 1880 to 1890, while in 7 of the 11 the increase in the country districts was more rapid in the later decade than in the earlier. Between 1880 and 1890 the cities of New England as a whole grew more slowly than those of any other minor division, but between 1890 and 1900 the urban increase in that division underwent scarcely any retardation, while in most other parts of the country it declined rapidly, so that between 1890 and 1900 the cities of New England surpassed in

rate of growth those of the Northern South Atlantic, Western North Central, and Basin and Plateau divisions.

The most rapid rate of growth during the last decade occurred, as a rule, in the small cities having from 2,500 to 4,000 or from 4,000 to 8,000 inhabitants, the slowest rate in the large cities having from 25,000 to 100,000, or 100,000 and over. It should be noted, however, that the relatively high rate for the cities within the lower limits of population is, to some extent, due to the fact that the basis on which these percentages are computed is generally small relative to that for the cities of larger population. This makes the exceptions to the rule all the more noteworthy. These exceptions appear in New England, in the Eastern North Central, the Western North Central, and the Pacific states. In New England the rate is highest in the cities having between 25,000 and 100,000 inhabitants and lowest in the group having between 2,500 and 4,000. This is true of the earlier as well as the later decade, and may be connected with the rapid development of secondary manufacturing centers. In the Eastern North Central states the cities having at least 100,000 inhabitants have grown faster during each of the two decades than any other group. In the Western North Central division while the highest rate of growth during the last decade was for cities having from 2,500 to 4,000 inhabitants, the lowest was for the group next above that, having from 4,000 to 8,000 inhabitants. In the Pacific states the relation of these two groups is reversed, the highest rate being shown for the latter group and the lowest for the former.

A remarkable feature in the growth of the Southern North Atlantic states is the sharp contrast between the smaller cities and the country districts. The rates increase from 32.6 per cent for the largest cities to 45.4 per cent for the smallest, and then suddenly drop to 3.4 per cent for the country districts. A similar abrupt transition is shown in the Eastern North Central states and to a less degree in New England.

MINOR CIVIL DIVISIONS.

The same method of analysis has been extended to include all the minor civil divisions of the country, that is, all the primary subdivisions of counties, whether incorporated or not. The nature of these subdivisions, comprising cities, towns, townships, hundreds, beats, precincts, districts, plantations, etc., is described in the "Explanations" prefixed to Table 5 of the first volume of the Twelfth Census (pages 51 to 53). Examination of that table, and of the corresponding tables of the Tenth and Eleventh censuses, shows that in certain parts of the country the population of county subdivisions has not been separately reported. In 1900 that was true of Arizona and Indian Territory; in 1890 of Arizona, Nevada, and Wyoming; in 1880 of those divisions and also of Colorado, Idaho, Montana, New Mexico, Dakota, and Washington. In addition to these entire states for which the population of minor civil divisions was not returned, there were parts of many other states for which the geographic basis was imperfect and minor civil divisions were not reported; these parts embraced a population of 97,871 in 1900, 769,470 in 1890, and 739,073 in 1880. Table XXVIII shows the result of classifying the population of the minor civil divisions of continental United States in 1900, 1890, and 1880, according to the number of inhabitants residing in each. In order to facilitate comparison with figures of foreign countries—10,000, 2,000, and 1,000 being population limits often employed abroad—a classification has been adopted which differs somewhat from that used in the tables relating to urban population.

From the explanations mentioned above it will be observed that minor civil divisions above a certain ill-defined limit of population are urban in character, but that below that limit they are either urban or rural or a combination of both. In a state like Mississippi, having on the average very extensive minor civil divisions as governmental units, the population of such divisions may be large and yet in no sense urban. The following tables, therefore, are substantially an urban classification in another form for the first four or five groups; below that they are merely a classification by the primary governmental divisions of the county and throw little light upon the distinction between urban and rural.

TABLE XXVIII.—NUMBER AND POPULATION OF MINOR CIVIL DIVISIONS CLASSIFIED BY SIZE: 1900, 1890, AND 1880.

[1] Excludes population of Indian Territory and Indian reservations.

Table XXVIII shows that in 1880 rather more than three million people, or about one-sixteenth of the entire population of continental United States, were living in the 4 cities having at least half a million inhabitants. In 1890 the total population of these cities had risen to nearly four and one-half millions. Between 1890 and 1900 the cities of New York and Brooklyn were consolidated, while the increase in the population of Baltimore, Boston, and St. Louis brought these 3 cities into the class having at least one-half million inhabitants. Thus in 1900 there were 6 cities above that limit, with an aggregate population of over eight millions—more than one-tenth of the population of continental United States. Both the number and the aggregate population of the minor civil divisions included in each smaller class increased in each ten years, this being due in part to the progressive subdivision of the territory of the United States and in part to the increasing accuracy and completeness with which the census has reported the population of minor civil divisions.

But when attention is directed to the changes in the per cent which each class forms of the total population, it appears that the proportion living in places of at least 5,000 inhabitants has steadily risen, while the proportion living in places of less than 5,000 inhabitants has steadily fallen. The per cent living in all places having at least 5,000 inhabitants was 30.8 in 1880, 37.9 in 1890, and 43.7 in 1900, while the per cent living in places of less than 5,000, including the unclassible, declined from 69.2 in 1880 to 62.1 in 1890 and 56.3 in 1900. The following table shows whether similar changes have been in progress in all 5 main geographic divisions:

TABLE XXIX.—NUMBER AND POPULATION OF MINOR CIVIL DIVISIONS CLASSIFIED BY SIZE, FOR MAIN GEOGRAPHIC DIVISIONS. 1900, 1890, AND 1880.

[1] Excludes population of Indian Territory and Indian reservations.

[2] Less than one-tenth of 1 per cent.

In the North Atlantic division the proportion of the population living in cities of half a million or more has risen from less than one-fifth in 1880 to one-fourth in 1900. Cities in that class remained the same, but this was due to the disappearance, within the last ten years, of Brooklyn as an independent municipality, offset by the advance of Boston into the class. In this geographic division most of the increase is found in places of over 25,000, those of 5,000 to 25,000 containing at the end of the period about the same proportion of the population as at the beginning, namely, 18.9 per cent in 1880 and 19.2 per cent in 1900, while in the classes of minor civil divisions with a population of less than 5,000, as in the country at large, there has been a decided relative decrease.

In the South Atlantic states, on the contrary, the large cities have not absorbed the growth. The 2 cities of over 100,000 inhabitants, Baltimore and Washington, included 6.7 per cent of the population in 1880, 7.5 per cent in 1890, and 7.5 per cent in 1900, this indicating an increase, in the last ten years, about the same as that for the whole division. The most noteworthy gain has been in the development between 1890 and 1900 of places having from 5,000 to 8,000 inhabitants, the number of which increased only 14 between 1880 and 1890, but no less than 70 between 1890 and 1900. Between 1880 and 1890 the proportion their population formed of the total increased only slightly, but between 1890 and 1900 it increased from 6.9 to 10.0 per cent. In the other classes the changes seem parallel to those in continental United States.

In the North Central division, as in the North Atlantic, the great cities have gained far more rapidly in population than the division as a whole. Of cities having at least 100,000 inhabitants there were 6 in 1880, 11 in 1890, and 14 in 1900. These cities had, in 1880, 8.6 per cent; in 1890, 14.3 per cent; and in 1900, 17.9 per cent of the total population—a proportion at the end of the twenty years more than twice that at the beginning. But the places having from 5,000 to 25,000 inhabitants, also, have grown very rapidly, constituting in 1880, 12.0 per cent; in 1890, 13.6 per cent; and in 1900, 15.1 per cent of the total population. The North Central division thus differs from the South Atlantic in that its most characteristic growth has been that of large cities, and from the North Atlantic in that the smaller places have increased more rapidly than the division as a whole.

In the South Central division the increase of population has in general been parallel to that in the South Atlantic. In the Western division a noteworthy feature is the degree of prominence attained as early as 1880 by the cities having at least 100,000 inhabitants; at that date San Francisco, the only city of that size in the division, contained more than one-eighth (13.2 per cent) of the entire population, while at the same date the 6 cities of the same class in the North Central division—Chicago, Cincinnati, Cleveland, Detroit, Milwaukee, and St. Louis—contained only 8.6 per cent of the population of the division. Since 1880, however, the proportion of the population of the Western division in cities of this class has changed comparatively little, although their number was increased by the addition of Denver in the first decade and Los Angeles in the second. In this respect the Western division resembles the two southern divisions. At the present time the proportion of the population living in cities of at least 100,000 inhabitants is notably greater in the North Central division than in the Western, while twenty years ago it was only about two-thirds as great. On the other hand, perhaps the most noteworthy feature in the growth of population in the Western division has been the rise of places having from 25,000 to 100,000 inhabitants, there being 10 of these in 1900, as against 1 in 1880, and the proportion of the population living therein in 1900 being nearly as great as in the cities of larger size—another feature in which the Western division resembles the two southern rather than the two northern divisions. The Western division agrees with the South Central also in that the population of places having between 2,000 and 5,000 inhabitants has gained on the entire population, whereas in the two northern and the South Atlantic divisions this group of places has not kept pace with the division as a whole.

TABLE XXX.—POPULATION OF MAIN AND MINOR GEOGRAPHIC DIVISIONS: 1790 TO 1900.

[1] Decrease.

PROPORTION OF THE SEXES.

SUMMARY OF RESULTS.

In continental United States there are 1,638,321 more males than females, or about 2 in each 100 people.

Probably in the population of the world as a whole, and certainly in that half of it which has been counted with distinction of sex, there are several million more males than females.

In continental United States, however, the relative excess of males is greater than the average for all countries.

Europe has an excess of females; every other continent, so far as known, has an excess of males.

The whole population of continental United States was first counted with distinction of sex in 1820. During the seventy years from 1830 to 1900 the absolute excess of males was greater at each census than at any preceding census with one exception, that of 1870, when the excess of males was less than in 1850 and 1860.

This reduction of the excess of males between 1860 and 1870 by about 300,000 was doubtless due to the deaths in the Civil War and the diminished immigration during the decade.

The greatest relative excess of males was in 1890, when in each 10,000 people there were 242 more males than females.

By 1900 this excess had decreased to 216 in 10,000, less than the relative excess in 1890 and 1860, but greater than that at each other census.

The divisions of continental United States with the smallest proportion of males are the District of Columbia (47.4 per cent), Massachusetts (48.7 per cent), and Rhode Island (49.1 per cent); those with the largest are Wyoming (62.9 per cent), and Montana (61.6 per cent).

As a rule sparsely settled regions have an excess of males and densely settled regions an excess of females.

Between 1890 and 1900 the divergence among the several states in this respect decreased and the proportion of males and of females in different sections became more nearly equal.

In 1880 about one-fourth and in 1900 less than one-sixth of the American counties had an excess of females.

American cities as a rule have more females than males. In the 1,861 cities, each having in 1900 at least 2,500 inhabitants, there were 201,959 more females than males, and this notwithstanding the many western cities which contained more males than females and the enormous number of foreign born in the country, five-ninths of them male and a large proportion of them living in the cities.

This tendency of American cities to develop a preponderatingly female population had increased since 1890 when, in the 1,490 cities, each having at least 2,500 inhabitants, there were 6,929 more males than females.

While the excess of 6,929 males in American cities in 1890 became an excess of 201,959 females in American cities in 1900, the excess of 1,519,559 males in country districts in 1890 became an excess of 1,840,280 males in 1900.

Or, expressing the facts in ratios, of each 1,000 inhabitants of such cities in 1890, 500 were males and in 1900, 497 were males; of each 1,000 inhabitants living outside these cities in 1890, 519 were males and in 1900, 520 were males. The difference thus in the number of males or of females between an average thousand of city and of country population in 1890 was 19 and in 1900, 23.

This conclusion is not materially modified when a more accurate method is employed and a comparison made between the figures in 1890 and 1900 for the same list of cities, namely, all which had at least 2,500 inhabitants at each date.

A marked and increasing dissociation of the sexes between city and country like that in the United States has been noted also in the leading countries of western Europe.

On the other hand, there is a large excess of males in the principal cities of Russia and India, and in Hongkong and Manila.

This excess of females in the cities of western Europe and eastern United States is probably due mainly to the greater opportunity for women to find employment in those cities and to their migration cityward in consequence.

But even among children under 5 years of age, a slight difference appears between cities having at least 25,000 inhabitants and the rest of the country. In such cities there are 503 males to each 1,000 children; outside of them there are 506 males to each 1,000 children.

These figures support but do not prove the theory that the proportion of male children at birth is slightly less in cities than in country districts.

Notwithstanding the great excess of males in the total population of the United States, there are two periods of life at which the reported number of females is greater. One, extending from about 83 years of age to the end of life, is probably due mainly to the longer average life of women; the other, from 16 to 25, is probably apparent rather than real, and due mainly to the greater number of women who claim, erroneously, to belong to this age period.

Among the negroes there are a few more females than males; among the Indians, a few more males than females. The marked excess of males among whites and Mongolians is doubtless due to the influence of immigration.

Among the Chinese said to have been born in the United States, nearly three-fourths are male, an incredible proportion, which is probably due to the false return of several thousand immigrant Chinese as native in the effort to elude the provisions of the exclusion laws.

At each of the last six censuses there has been an excess of males among native white population ranging, at each census except that of 1870, from one-quarter to three-quarters of a million. These figures are probably swollen by an indeterminate amount as a result of the return of a certain number of foreign born as native.

In 1900, among the 13,367,147 persons attending school, 499 in each 1,000 were male and 501 female; in 1890, in the same class, 510 per 1,000 were male and 490 female.

Among the whites attending school there is still a slight excess of males; among the Indians and Mongolians, a very marked excess of males. The slight excess of females in the total population reported in 1900 as attending school is due to a very decided excess of females among the negro school attendants.

In all races and in all parts of the country there has been a decided increase since 1890 in the proportion of females among persons attending school. This increase is due mainly to the increase in the proportion of young women among persons at least 15 years of age attending school, the increase at this age period being nearly five times as great as at any other and more than three times as great as the average increase for all ages.

In 1890, among each 1,000 persons at least 15 years of age attending school, 528 were male; in 1900 only 490 were male.

No important change took place in the large cities. The change for the whole country was due to a rapid decrease outside of the cities in the proportion of young men among the persons at least 15 years of age attending school, the figures for the country districts approaching rapidly the proportion found in cities in 1900 and 1890.

When the school attendants of a specified class are compared with the total population of the same age and class, a noticeable contrast between the negro and the foreign born white population appears, the per cent of female negroes attending school at each age being larger than that of male negroes, and the per cent of female foreign born whites attending school at each age smaller than that of male foreign born whites.

Even for the age period 10 to 14 there has been, during the last decade, a slight decrease in the proportion of males attending school to male population, somewhat more than counterbalanced by an increase in the proportion of females attending school to female population.

The death rate of males in the registration area of the United States in 1900 was 19.0 per 1,000, and that of females 16.6 per 1,000, the former having a death rate higher by about one-seventh than the latter. In the 346 registration cities the death rate of males was 20.0 and that of females 17.2 per 1,000, the male rate exceeding the female by one-sixth. In the rest of the registration area the male death rate was 15.8 and that of females 15.0 per 1,000, the male rate exceeding the female by one-nineteenth.

The difference in the death rate of the sexes is apparently least between the ages of 5 to 14 and greatest at the youngest and oldest ages.

Life tables for Massachusetts, England, Prussia, and Norway confirm these conclusions and make them precise. They indicate that male children under 3 years of age have uniformly a higher death rate than female children.

There is a period between 5 and 21 years of age in which the death rate of females is slightly higher than that of males. According to the Massachusetts life table this period covers seventeen years, 5 to 21; according to the Norwegian life table, eleven years, 5 to 15; according to the Prussian life table, nine years, 8 to 16; and according to the English life table, eight years, 14 to 21.

According to all the life tables the death rate of women between 20 and 30 years of age, at which ages probably a majority of the childbirths occur, was less than that of males.

SEX.

Definition of terms.—There are no words in common use for human beings of the male sex and the female sex regardless of age, the words man and woman being confined to adults, and the words male and female including not merely the human but all animal species, the former being, therefore, too narrow, and the latter too broad. To modify the popular meaning of either

set of terms was far easier than to attempt the introduction of a new pair. Census practice has chosen the second pair, and for census purposes the word male means a human being of the male sex and of any age; the word female a human being of the female sex and of any age.

Margin of error.—In this field of census work there is no ambiguity of terms, and in the United States there is no unwillingness on the part of any race, age, or class of the population to give correct answers to the question of sex. Hence the amount of conscious and intentional error in the answers is probably infinitesimal.

But the census returns are obtained by enumerators who inquire from dwelling house to dwelling house throughout the United States regarding the families there residing. A small minority of the population have no dwelling house even in the loose sense in which that term is defined by the Census Office, namely, the place where a person regularly sleeps.[1] Such persons without habitation are somewhat likely not to be counted, and also are likely to be predominantly males. Hence failures of enumerators to reach this class are likely to result in the omission of males more commonly than of females.

These reasons for anticipating a greater proportionate omission of males are not confirmed, however, by the results of a recount in Maryland. In 2 counties of the state and 11 of the 19 enumeration districts in a third county, a careful reenumeration was made soon after the original count, in the effort to gather evidence upon which indictments of the enumerators for false and fraudulent returns might be based. The work was done under the direct and personal superintendence of officials trained in the Census Office, and there is no reason to doubt the accuracy of their conclusions. The reenumeration showed a population of 60,934, and of these 1,554 or 2.6 per cent had been omitted by the enumerators. It included 31,762 males, and of these 817 or 2.6 per cent had been omitted; it included 29,172 females, and of these 737 or 2.5 per cent had been omitted. Thus the difference in the per cent of omissions according to sex was insignificant. But in the case in hand a strenuous effort was made, for political reasons, to make the first enumeration absolutely complete. The political henchmen employed as enumerators and their superiors doubtless had fuller information regarding the male population, and especially the potential voters than regarding the females. This may perhaps account for the disagreement between the theoretical considerations and the results of a recount. On the whole, the results of this slight experimental test are believed to be insufficient to outweigh the reasons already given for believing that males are more usually omitted.

[1] Twelfth Census, Instructions to Enumerators, Sec. 99.

The homeless class and the class whose homes or sleeping places are so ill-defined and unrecognizable as to escape the enumerators' attention constitute perhaps a larger proportion of the population in cities and towns than they do in any but the most sparsely settled country districts. If so, the omissions due to this cause would be more frequent in cities and towns than in country districts and may be a factor in producing the excess of females in the urban districts of the United States. But this cause of error, if it exists, is probably a slight one, and exercises little influence upon the figures. As there seems to be no means of determining with certainty whether it exists, much less is there any means of measuring its magnitude. There is no reason, therefore, to believe that misstatements of facts or omissions in the count, or the two combined, play a significant part in accounting for the sex composition of the population of the United States and its several parts. The reported facts may be deemed a correct mirror of the reality.

United States.—The sex composition of the population is known for 84,244,316, or 99.2 per cent of the 84,907,156 persons in the United States in 1900. The facts for the several divisions appear in the following table:

TABLE I.—*Sex composition of the population of the United States about 1900.*

DIVISION.	Date of census.	POPULATION.				
		Total.	Male.	Female.	Per cent male.	Per cent female.
Total		84,244,316	43,028,155	41,216,161	51.1	48.9
Continental United States	1900	75,994,575	38,816,448	37,178,127	51.1	48.9
Alaska	1900	63,592	45,872	17,720	72.1	27.9
Hawaii	1900	154,001	106,369	47,632	69.1	30.9
Military and naval	1900	91,219	90,553	666	99.3	0.7
Philippine Islands[1]	1903	6,987,686	3,496,652	3,491,034	50.0	50.0
Porto Rico[2]	1899	953,243	472,261	480,982	49.5	50.5

[1] Census of the Philippine Islands, 1903, Vol. II, page 14.
[2] War Department Census of Porto Rico, 1899, page 164.

Table 1 shows that in Alaska and Hawaii about 7 persons out of 10 are males, but in continental United States there are about 2 more males than females in an average 100 of the population. The inhabitants of the Philippine Islands, exclusive of the wild tribes not classified by sex, are divided almost equally between the two sexes. The number of males exceeds the number of females by no more than 5,618 in the total population of 6,987,686 whose sex composition is known. In Porto Rico, on the other hand, females are somewhat more numerous than males.

For purposes of comparison with the figures of continental United States, the following per cents from a trustworthy secondary authority have been introduced:

TABLE II.—*Sex composition of enumerated population in the several continents.*[1]

CONTINENT.	POPULATION ABOUT 1890.				
	Total.	Male.	Female.	Per cent male.	Per cent female.
Total	793,668,722	399,301,857	394,366,865	50.3	49.7
Europe	345,732,680	170,818,561	174,914,119	49.4	50.6
America	82,183,775	41,643,389	40,540,386	50.7	49.3
Africa	13,765,424	6,994,064	6,771,360	50.8	49.2
Asia	347,917,223	177,648,044	170,269,179	51.1	48.9
Australia	4,069,620	2,197,799	1,871,821	54.0	46.0

[1] Data from Karl Bücher, "Ueber die Verteilung der beiden Geschlechter auf der Erde," in Allgemeines Statistisches Archiv, Vol. II, page 374.

So far as has been determined by enumeration (and in Africa only about one-twelfth and in Asia about two-fifths of the estimated population have been enumerated with distinction of sex) every continent except Europe has an excess of males, and in the total enumerated population of the earth there is a slight excess of persons of that sex. About one-half of the total estimated population of the earth has been counted with distinction of sex, and of this half 50.3 per cent were males and 49.7 per cent were females. In every continent except Australia the number of the two sexes approaches close to equality. The relative excess of males in the United States is thus seen to be slightly greater than the probable excess in the world as a whole. Where the population of countries little touched by civilization or reached by it only in recent years has been enumerated, and the proportion of the sexes has not been materially affected by immigration or emigration, it is usually found that the male population is somewhat in excess of the female. This is true in India and Japan and warrants the inference that the same is probably true of the main bodies of unenumerated population, such as China and most of Africa. For this reason it seems not improbable that the excess of males in the total population of the earth is somewhat greater than that indicated by the preceding figures.

Continental United States.—For the first three censuses the sex composition of the negro population was not reported. On this account the earliest figures in Table III are those for 1820.

TABLE III.—*Population of continental United States, classified by sex: 1820 to 1900.*

CENSUS.	POPULATION.				NUMBER OF SEX SPECIFIED IN EACH 10,000.		
	Total.	Male.	Female.	Excess of males.	Male.	Female.	Excess of males.
1900	75,994,575	38,816,448	37,178,127	1,638,321	5,108	4,892	216
1890[1]	62,947,714	32,237,101	30,710,613	1,526,488	5,121	4,879	242
1890[2]	62,622,250	32,067,880	30,554,370	1,513,510	5,121	4,879	242
1880	50,155,783	25,518,820	24,636,963	881,857	5,088	4,912	176
1870	38,558,371	19,493,565	19,064,806	428,759	5,056	4,944	112
1860	31,443,321	16,085,204	15,358,117	727,087	5,116	4,884	232
1850	23,191,876	11,837,660	11,354,216	483,444	5,104	4,896	208
1840	17,069,453	8,688,532	8,380,921	307,611	5,090	4,910	180
1830	12,866,020	6,532,489	6,333,531	198,958	5,077	4,923	154
1820	9,638,453	4,896,605	4,741,848	154,767	5,080	4,920	160

[1] Includes population of Indian Territory and Indian reservations.
[2] Excludes population of Indian Territory and Indian reservations.

Table III shows that the numerical excess of males in 1900 was more than ten times what it was in 1820; that the excess increased steadily and rapidly from 1820 to 1860, but decreased between 1860 and 1870 to a smaller amount than it was in 1850, a decrease due probably both to the excess of deaths among males caused by the Civil War and also to the check upon immigration in that decade. The excess in 1880 was more than double that in 1870, and that in 1890, 70 per cent greater than that in 1880. During the last decade the increase in the excess of males has been less than for many decades. But this steady increase in the numerical excess is due mainly to the increase of population. The last two columns of the table show that the excess relative to population has been far more nearly constant. The relative excess of males decreased slightly from 1820 to 1830, and then increased rapidly for thirty years until the eve of the Civil War. The decade between 1860 and 1870 reduced this excess by more than one-half, but from 1870 to 1890 the excess of males again increased so rapidly that in the latter year it was greater than at any other census, even that of 1860. During the last decade there has been a slight decline in the relative excess of males, but the proportion at the end of the century was greater than at any other census year except 1890 and 1860.

Geographic divisions.—The number and per cent of males and of females in each state and territory and in each main division are given in the Abstract of the Twelfth Census, Table 38. The following table gives the same information for the 11 minor divisions:

TABLE IV.—SEX BY MINOR GEOGRAPHIC DIVISIONS: 1900 AND 1890.

DIVISION.	POPULATION.							
	1900		1890		Per cent male.		Per cent female.	
	Male.	Female.	Male.	Female.	1900	1890	1900	1890
Continental United States	38,816,448	37,178,127	32,237,101	30,710,613	51.1	51.2	48.9	48.8
New England	2,763,796	2,828,221	2,313,759	2,386,990	49.4	49.2	50.6	50.8
Southern North Atlantic	7,761,081	7,693,597	6,366,898	6,339,322	50.2	50.1	49.8	49.9
Northern South Atlantic	2,240,576	2,223,905	1,925,411	1,934,638	50.2	49.9	49.8	50.1
Southern South Atlantic	2,982,019	2,996,980	2,493,360	2,504,513	49.9	49.9	50.1	50.1
Eastern North Central	8,177,308	7,808,273	6,916,423	6,561,882	51.2	51.3	48.8	48.7
Western North Central	5,412,014	4,935,409	4,702,167	4,229,945	52.3	52.6	47.7	47.4
Eastern South Central	3,809,666	3,738,091	3,241,635	3,187,519	50.5	50.4	49.5	49.6
Western South Central	3,372,256	3,160,034	2,457,789	2,283,194	51.6	51.8	48.4	48.2
Rocky Mountain	700,953	531,689	518,882	348,676	56.9	59.8	43.1	40.2
Basin and Plateau	239,085	202,930	192,749	153,628	54.1	55.6	45.9	44.4
Pacific	1,357,694	1,058,998	1,108,028	780,306	56.2	58.7	43.8	41.3

Table IV shows that in each of the 11 divisions of the United States, except New England and the Southern South Atlantic, there was an excess of males in 1900, and that this excess reached its maximum in the Rocky Mountain states and territories where the males were nearly 57 per cent of the entire population. It shows also what has appeared already from various points of view that the statistical differences between different parts of the United States have decreased in ten years. Thus in 1890 the males in New England were only 49.2 per cent of the total population, while in the Rocky Mountain states they were 59.8 per cent, a difference of 10.6 per cent. In 1900 the per cent of males in New England had slightly increased and that in the Rocky Mountain states had decidedly decreased; the difference between the two extremes, therefore, declined from 10.6 to 7.5 per cent.

States and territories.—In the following table the states and territories are arranged in two columns in the order of increasing per cent of males at each of the last two censuses:

TABLE V.—*States and territories arranged in order of increasing proportion of males: 1900 and 1890.*

STATE OR TERRITORY.	Per cent male: 1900.	STATE OR TERRITORY.	Per cent male: 1890.
District of Columbia	47.4	District of Columbia	47.6
Massachusetts	48.7	Massachusetts	48.6
Rhode Island	49.1	Rhode Island	48.6
Maryland	49.6	North Carolina	49.4
North Carolina	49.6	Connecticut	49.5
South Carolina	49.6	Maryland	49.5
New York	49.7	New Hampshire	49.5
Georgia	49.8	New York	49.6
New Hampshire	49.9	South Carolina	49.7
Virginia	49.9	Virginia	49.8
Connecticut	50.0	New Jersey	49.9
New Jersey	50.0	Louisiana	50.0
Alabama	50.1	Alabama	50.1
Louisiana	50.3	Georgia	50.1
Mississippi	50.4	Maine	50.3
Maine	50.5	Mississippi	50.4
Tennessee	50.5	Tennessee	50.4
Ohio	50.6	Ohio	50.5
Kentucky	50.8	Kentucky	50.7
Pennsylvania	50.8	Pennsylvania	50.7
Delaware	51.0	Delaware	50.8
Vermont	51.0	Vermont	50.9
Indiana	51.1	Indiana	51.0
Utah	51.2	West Virginia	51.2
Illinois	51.3	Illinois	51.5
Missouri	51.4	Florida	51.6
Arkansas	51.5	Missouri	51.7
Michigan	51.6	Arkansas	51.9
Wisconsin	51.6	Wisconsin	51.9
Iowa	51.8	Iowa	52.0
Texas	51.8	Michigan	52.1
Florida	52.1	Texas	52.5
West Virginia	52.1	Kansas	52.7
Kansas	52.3	Utah	53.1
Nebraska	52.9	Minnesota	53.4
Minnesota	53.2	Indian Territory	53.6
Indian Territory	53.3	New Mexico	53.9
New Mexico	53.4	Nebraska	54.1
Oklahoma	53.8	South Dakota	54.5
South Dakota	53.8	North Dakota	55.3
Colorado	54.7	Oklahoma	55.4
California	55.3	Arizona	57.5
North Dakota	55.6	Oregon	57.8
Oregon	56.3	California	57.9
Idaho	57.7	Colorado	59.5
Arizona	58.4	Idaho	60.2
Washington	58.7	Washington	62.0
Nevada	60.5	Nevada	63.4
Montana	61.6	Wyoming	64.3
Wyoming	62.9	Montana	65.2

The interpretation of Table V will be aided by a glance at the maps on page 92, the upper one grouping the states in the order of the per cent of males in 1900, the lower grouping them as they stood in 1890. From either table or maps it is apparent that the excess of males in the far Western states, while well marked at each census, was less conspicuous in 1900 than in 1890. The proportion of males in the states and territories at the head of the two columns changed little, but the proportion in those at the foot of the two columns fell notably: Montana, 3.6 per cent; Wyoming, 1.4 per cent; Nevada, 2.9 per cent; Washington, 3.3 per cent. The states in 1900 show a range of 15.5 per cent between the highest and lowest, while in 1890 they had a range of 17.6 per cent; moreover, the mean departure of the per cents from 50 was 3.3 for 1890 and only 2.7 for 1900; both of these facts show that the changes have been in the direction of establishing a closer approach to equality in the proportion of the sexes and reducing the differences among the states and territories.

Perhaps the most noteworthy fact revealed by Table V or the two maps is the position of Utah. In 1890 it had a smaller excess of males than any other state or territory in the Western division and 6 of the 12 states or territories of the Central divisions west of the Mississippi. By 1900 the excess of males had been still further reduced, so that its position in Table V rose from 34 to 24, with a per cent of males less than in 5 states east of the Mississippi and all states west of that river except Louisiana. In West Virginia and Florida, both having an excess of males in 1890, the excess so increased that in 1900 the rank of West Virginia is 9 and that of Florida 6 lower.

Table V shows that the proportion of males in the District of Columbia is fully 1 per cent less than in any state or territory. From a table showing the density of population[1] it appears that the District of Columbia is much the most densely settled of the fifty divisions of the United States. Its very high density and the marked excess of females in its population may have some connection. Table V also shows that Rhode Island and Massachusetts, the second and third states in order of density of population, are third and second in the order of the preponderance of females, both of them differing not a little from the nearest states, a fact that would be in general conformity with the hypothesis. The most sparsely settled states and territories, moreover, have as a rule, the largest excess of males. These may be mere coincidences due to the fact that the sparsely settled regions are the states and territories of the far West to which men have migrated more than women and the densely settled regions are in the East, from which enough men have departed to affect the proportion of the sexes.

Counties.—To ascertain whether densely settled communities in the United States generally have a proportion of females larger than that of sparsely settled districts in their vicinity, the analysis has been extended to the counties by means of Table VI, in which the per cent of males is shown for the most

[1] Page 27.

densely settled and the most sparsely settled county in each state and territory.

TABLE VI.—*Per cent of males in counties of greatest and least density of population, by states and territories: 1900.*[1]

STATE OR TERRITORY.	County of greatest density of population.	Density.	Per cent male.	County of least density of population.	Density.	Per cent male.

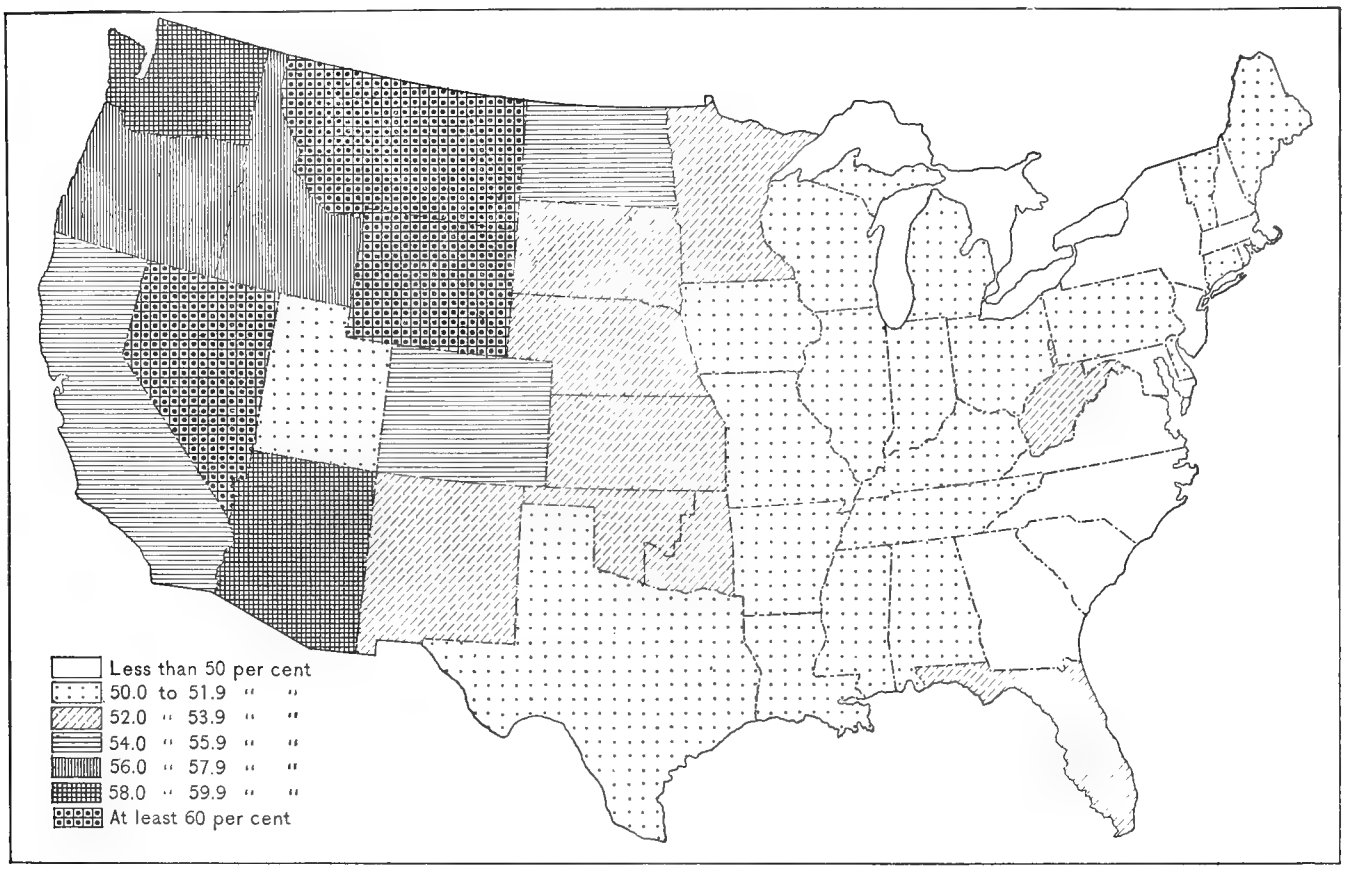
Wyoming	Albany	3.0	67.3	Natrona	0.3	64.8

[1] The District of Columbia and Indian Territory are omitted in the table because they do not contain county divisions.
[2] Less than one person to 10 square miles.

Examination of Table VI shows that in 39 of the 48 states and territories the most densely settled county has a smaller per cent of males than the most sparsely settled county. The hypothesis that there is some connection between a dense population and a preponderance of females as well as between a sparse population and a preponderance of males seems to be confirmed. Some instances are worthy of note. New York state contains the most densely settled county in the country, and also, in Hamilton county, one of the most sparsely settled east of the Mississippi. New York county has more females than males, while in Hamilton county nearly three-fifths of the population are males. In Fulton county, Ga., which includes Atlanta, there are six more females than males in each hundred of the population, while in Charlton county, of the same state, much of which consists of Okefinokee swamp, there are five more males than females in every hundred of the population.



Careful study of the preceding table shows that almost without exception sparsely settled counties have a per cent of male population above the average. As a rule densely settled counties have a per cent of male population below the average, but there are a few exceptions. The character of the prevailing occupations, such as mining and iron working in Jefferson county, Ala., may explain several of them.

In the discussion of the figures for sex by states and territories it was shown that the differences in the proportion of the sexes among the several states have been decreasing. It would probably be true for counties also that the range between the extremes was less in 1900 than in 1890, but the per cent of males in the total population of each county in 1890 has not been computed, and therefore this comparison can not be made. It is true, however, that while the total number of counties in continental United States has been steadily increasing in the last twenty years, the number with excess of females has been steadily declining. In 1880, of 2,568 counties, 617, or 24.0 per cent; in 1890, of 2,789 counties, 505, or 18.1 per cent; and in 1900, of 2,850 counties, 461, or only 16.2 per cent, had an excess of females. The proportionate number of counties with excess of females in 1900 was thus only two-thirds of what it was in 1880. Two causes may be suggested as probably cooperating to explain the change: First, the normal proportion of the sexes, which was disturbed by the Civil War, has been gradually reestablished by the balance of births and deaths, and secondly, the decrease in the western migration of men has left fewer eastern sections with an excess of women. The total number of counties and the number and per cent of them with excess of females are given for the main and minor geographic divisions in the following table:

TABLE VII.—NUMBER AND PER CENT OF COUNTIES WITH EXCESS OF FEMALES: 1900, 1890, AND 1880.

DIVISION.	TOTAL NUMBER OF COUNTIES.			COUNTIES WITH EXCESS OF FEMALES.			PER CENT OF COUNTIES WITH EXCESS OF FEMALES.		
	1900	1890	1880	1900	1890	1880	1900	1890	1880
Continental United States	2,850	2,789	2,568	461	505	617	16.2	18.1	24.0

MAP 12.—PER CENT MALE IN TOTAL POPULATION, FOR STATES AND TERRITORIES: 1900.

MAP 13.—PER CENT MALE IN TOTAL POPULATION, FOR STATES AND TERRITORIES: 1890.

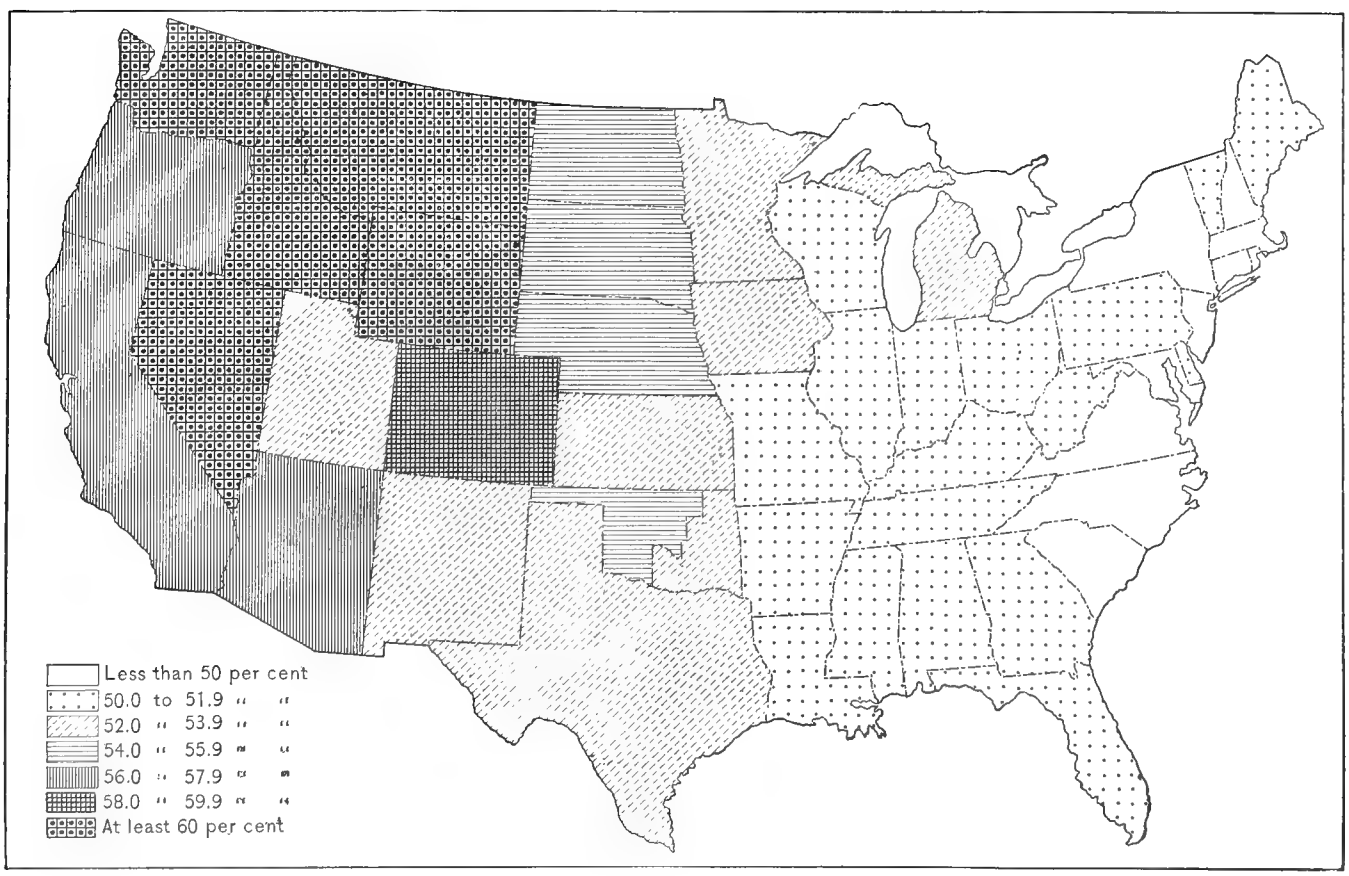

Table VII shows that in the five divisions west of the Mississippi and also in the Eastern North Central division the counties with excess of females are in no case as many as 1 in 10, while in the other five divisions such counties constitute from more than 2 in 10 in the Eastern South Central to 5 in 10 in the Southern South Atlantic. The South Atlantic division at each census also has had a larger proportion of counties with excess of females than the North Atlantic division at the corresponding census. The same is true when the two Eastern Central divisions and the two Western Central divisions are compared with each other. This difference between North and South is probably connected with the greater effect of immigration upon the North. When the two sections are compared as wholes, excluding the Western division, it appears that in 1890, 51.0 per cent of the population of the North and 50.5 per cent of that of the South were male, the North having 5 more males than the South in each 1,000 people. In 1900 the per cent of males was 50.9 in the North and 50.6 in the South, showing at that census in the North only 3 more males in each 1,000 people.[1] The distribution of the sexes in the United States is being equalized not only as between East and West, but also as between North and South.

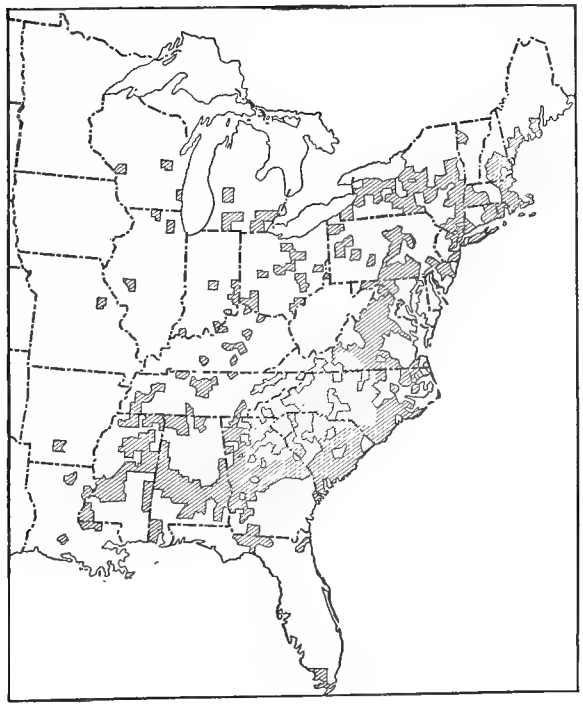
To illustrate further this decreasing number of counties having an excess of females, two outline maps for the region east of a line from North Dakota to Texas have been prepared, showing the regions where the females exceeded the males in 1880 and in 1900. In the western half of the country not shown on these maps almost every county had an excess of males at each census.

[1] For figures from which these per cents have been derived, see Twelfth Census, Abstract, Tables 35 and 38.



Comparison of these two maps shows that in Illinois, Wisconsin, and Michigan, there were a few more counties in 1900 than in 1880 with an excess of females. These three states in 1880 had only two such counties, while in 1900 they had 13. In Ohio the number had fallen from 21 to 14; in Kentucky, from 20 to 10; in Tennessee, from 51 to 18; in Alabama, from 51 to 28. The two maps bring out much more clearly than Table VII the decreasing area in the eastern United States in which the female population outnumbers the male.

Physiographic divisions.—In Table VIII the population of the physiographic divisions in 1900 has been given with distinction of sex and with per cent of males and of females.

TABLE VIII.—*Sex by physiographic divisions.*

DIVISION.	POPULATION: 1900.				
	Total.	Male.	Female.	Per cent male.	Per cent female.
Continental United States	75,994,575	38,816,448	37,178,127	51.1	48.9
New England hills	10,260,153	5,081,974	5,178,179	49.5	50.5
Coast lowlands	1,865,952	938,699	927,253	50.3	49.7
Coastal plain (east of the Mississippi river)	6,427,635	3,217,201	3,210,434	50.1	49.9
Piedmont region	6,809,103	3,369,547	3,439,556	49.5	50.5
Appalachian valley	4,499,072	2,260,992	2,238,080	50.3	49.7
Allegheny plateau	6,070,246	3,120,137	2,950,109	51.4	48.6
Lake region	9,571,215	4,918,303	4,652,912	51.4	48.6
Interior timbered region	8,129,760	4,119,189	4,010,571	50.7	49.3
Mississippi alluvial region	1,227,094	631,749	595,345	51.5	48.5
Prairie region	13,300,970	6,915,549	6,385,421	52.0	48.0
Ozark hills	1,203,880	621,772	582,108	51.6	48.4
Coastal plain (west of the Mississippi river)	1,974,677	1,016,554	958,123	51.5	48.5
Great plains	1,052,719	577,115	475,604	54.8	45.2
Rocky mountains	592,972	346,476	246,496	58.4	41.6
Columbian mesas	356,758	203,786	152,972	57.1	42.9
Great basin	375,345	199,040	176,305	53.0	47.0
Plateau region	201,669	117,356	84,313	58.2	41.8
Pacific valley	995,363	579,839	415,524	58.3	41.7
Coast ranges	1,079,992	581,170	498,822	53.8	46.2

MAP 14.—*Counties having an excess of females: 1900.*

MAP 15.—*Counties having an excess of females: 1880.*

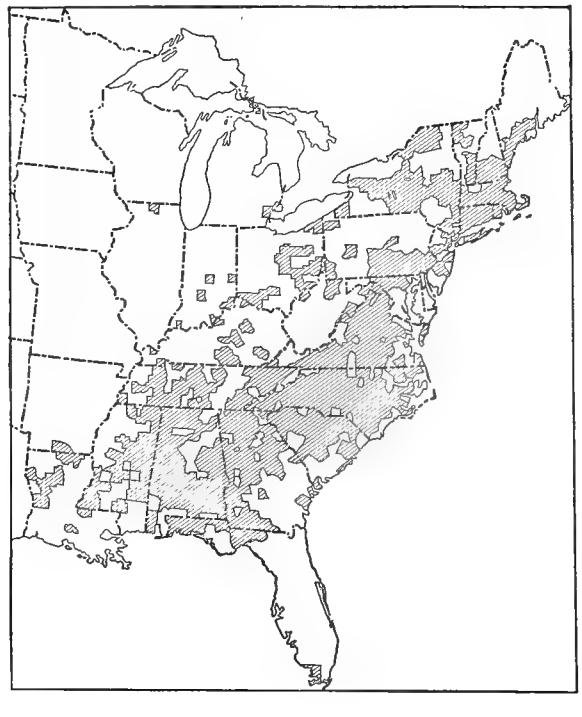


Table VIII shows that in only 2 of the 19 physiographic divisions, namely, the New England hills and the Piedmont region, did the females outnumber the males, and that the excess of males rises to its maximum in the Rocky mountains, Pacific valley, and the Plateau region, in all three of which it is over 58 per cent. In the Columbian mesas it is 57.1 per cent, while nowhere else does it reach 55 per cent.

In the following table the per cent of male population for each of these physiographic divisions at the last three censuses is given, two series of per cents being given for 1890, one including and the other excluding the specially enumerated Indian population, the former being suitable for comparison with the figures of 1900, the latter with the figures of 1880. The actual numbers on which the per cents are based will be found in Tables XXXVI and XXXVII of this section.

TABLE IX.—*Per cent male in the total population, for physiographic divisions: 1900, 1890, and 1880.*

DIVISION.	PER CENT MALE IN TOTAL POPULATION.			
	1900	1890[1]	1890[2]	1880
Continental United States	51.1	51.2	51.2	50.9
New England hills	49.5	49.3	49.3	48.9
Coast lowlands	50.3	49.9	49.9	49.3
Coastal plain (east of the Mississippi river)	50.1	50.0	50.0	49.7
Piedmont region	49.5	49.4	49.4	49.0
Appalachian valley	50.3	50.4	50.4	49.7
Allegheny plateau	51.4	51.0	51.0	50.4
Lake region	51.4	51.8	51.8	51.8
Interior timbered region	50.7	50.6	50.6	50.6
Mississippi alluvial region	51.5	51.7	51.7	51.5
Prairie region	52.0	52.3	52.3	52.5
Ozark hills	51.6	51.7	51.4	51.3
Coastal plain (west of the Mississippi river)	51.5	51.7	51.7	51.5
Great plains	54.8	56.8	57.2	61.2
Rocky mountains	58.4	60.8	61.1	65.3
Columbian mesas	57.1	58.8	59.1	62.8
Great basin	53.0	55.5	55.6	57.6
Plateau region	58.2	58.6	61.7	68.4
Pacific valley	58.3	60.5	60.5	61.8
Coast ranges	53.8	56.9	56.9	57.6

[1] Includes population of Indian Territory and Indian reservations.
[2] Excludes population of Indian Territory and Indian reservations.

For all regions east of the Mississippi the two series of figures for 1890 agree. The table shows that in the New England hills and the Piedmont region, the only two regions having an excess of females in 1900, the proportion of males has been slowly increasing for twenty years. Three other physiographic divisions, namely, the Coast lowlands, the eastern Coastal plain, and the Appalachian valley, had an excess of females in 1880, but not in 1900. On the other hand, the per cent of males in the Rocky mountains has declined from 65.3 in 1880 to 58.4 in 1900, and in the Plateau region the decline has been yet more rapid, from 68.4 to 58.2 per cent, although there, as a result of the sparseness of the population, the Indians present and counted in 1900, but not in 1880, have exerted more influence upon the total figures. In the Pacific valley, on the other hand, the decrease in the proportion of males has been less rapid, so that this physiographic division, which ranked fourth in order of excess of males in 1880, ranked second in 1900. In 1880 the difference between the extremes was 19.5 per cent and in 1900 it was only 8.9, or less than half as great.

City and country.—The fact has already been noticed that as a rule the most densely settled states and counties have a larger proportion of females than the sparsely settled ones in the same region. Especially noteworthy in this respect is the District of Columbia, the only distinctly urban member of the state and territory group. It has 13 more females in 1,000 of its population than any other state or territory, and 22 more than any other except the two most densely settled states of Rhode Island and Massachusetts. (Table v, page 90.) It may be that cities generally, like this particular city of Washington, have a larger proportion of females than the country districts in their vicinity. As previously explained, the line between city and country has been drawn for the purposes of this report at a population of 2,500. The sex distribution of the urban and rural population at the last census was as follows:

TABLE X.—*Population of continental United States living in cities having at least 2,500 inhabitants and in country districts, classified by sex and per cent distribution by sex: 1900.*

	POPULATION: 1900.				
	Total.	Male.	Female.	Per cent male.	Per cent female.
Continental United States.	75,994,575	38,816,448	37,178,127	51.1	48.9
Cities having at least 2,500 inhabitants	30,583,411	15,190,726	15,392,685	49.7	50.3
Country districts	45,411,164	23,625,722	21,785,442	52.0	48.0

The preceding figures show that in 1900 among 1,000 inhabitants of cities there were 23 more females than among 1,000 inhabitants of country districts. On comparing this difference with the figures in Table v, it will be seen that in the matter of sex distribution the difference between city and country in 1900 was equal to that between New Jersey and Kansas, or taking Southern states for comparison, to that between North Carolina and Texas. It is clear, therefore, that in the United States the distribution of the sexes in city and country is very unlike.

A similar difference between the proportions of the sexes in urban and rural districts appears in most of the countries of western Europe, and probably indeed in most countries of the civilized world. Two noteworthy exceptions are found in the cities of Russia and India. In all the cities of Russia in 1897 the males outnumbered the females by more than one million and constituted 53 per cent of the entire urban population. In the country districts of Russia, on the contrary, the females outnumbered the males by one and two-thirds millions, and constituted 50.8 per cent of the entire rural population.

In India the preponderance of males in the great cities seems far greater than in Russia. In Calcutta,

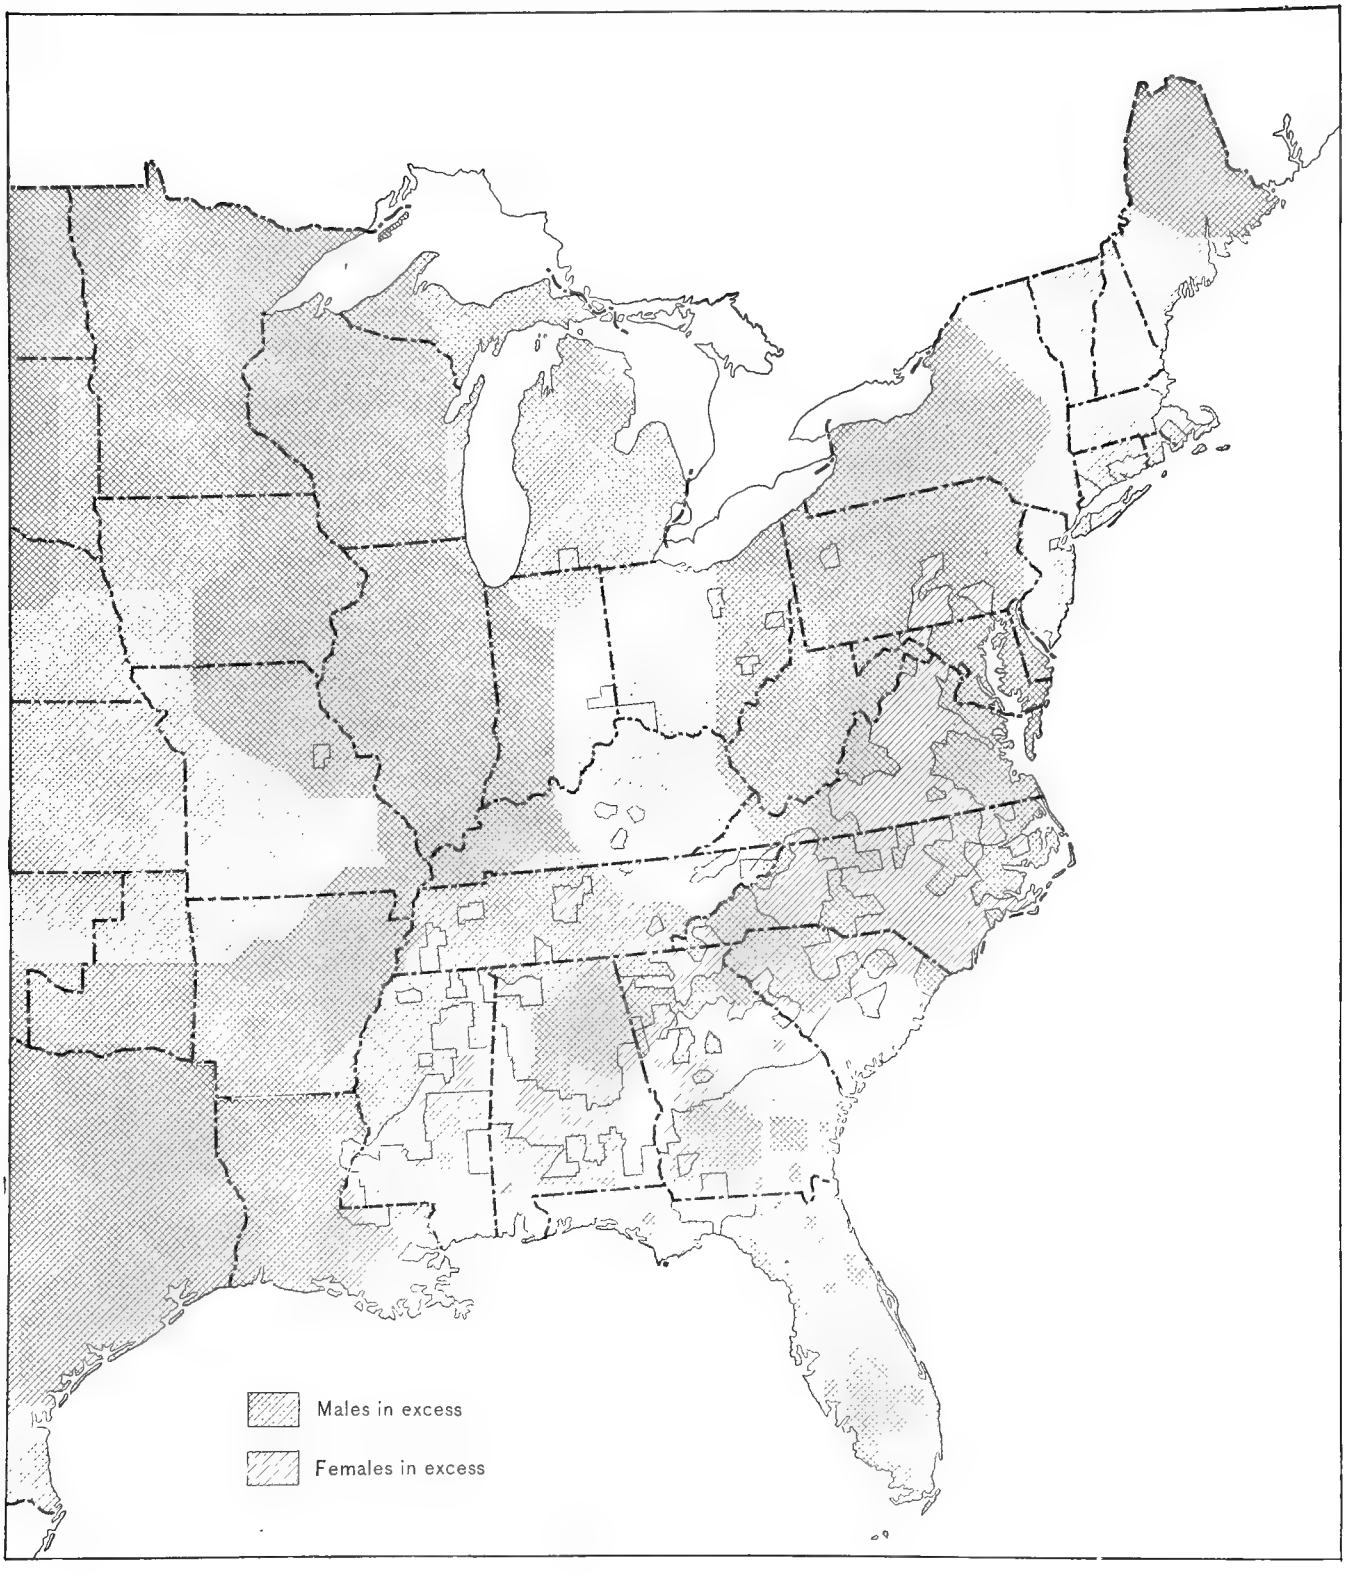
according to the preliminary report for the census of 1901, there were 643 males in every 1,000 of the population, in Bombay there were 616, and in Madras 505. In Hongkong in 1901 there were 726 males to 1,000 population and in Manila in 1887 there were 582 males in 1,000 population. Apparently the population of oriental cities as a rule has an excess of males and that of occidental cities as a rule an excess of females.

This concentration of the female population in cities and of the males in country districts, when taken in connection with the facts that four-fifths of the urban population of continental United States live in the North and West (for figures see page 20), and that in those regions the foreign born are very numerous, are predominantly male, and abound especially in the cities, seems unexpected enough to invite further analysis. For the figures on which the ratios of the following table are based, see Tables XXIX and XXXI of this section.

TABLE XI.—*Males in each 1,000 total population of cities having at least 2,500 inhabitants and of country districts, and excess of males in country districts, for main and minor geographic divisions: 1900.*

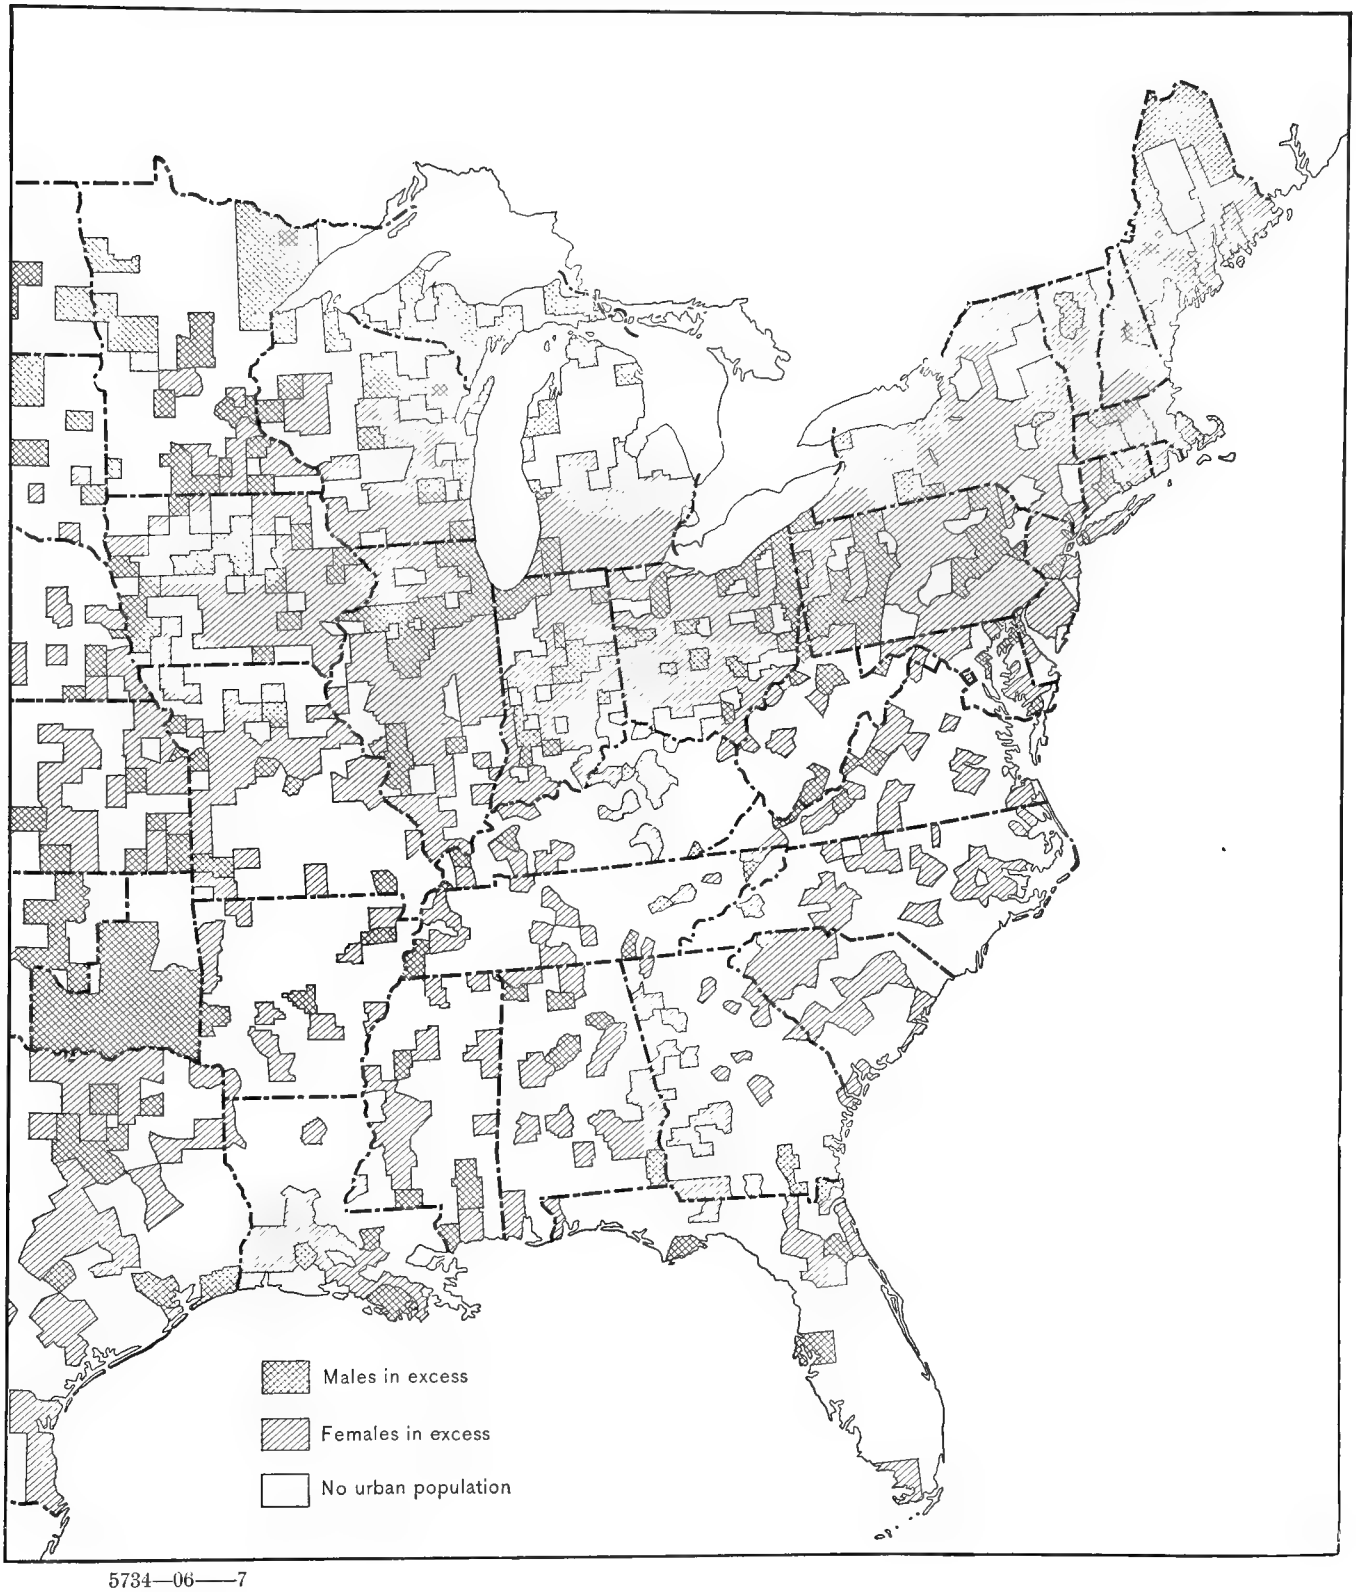
DIVISION.	MALES IN EACH 1,000 TOTAL POPULATION: 1900.		Excess of males in country districts.
	Of cities.	Of country districts.	
Continental United States	497	520	23
North Atlantic division	493	515	22
New England	488	513	25
Southern North Atlantic	495	516	21
South Atlantic division	478	506	28
Northern South Atlantic	481	511	30
Southern South Atlantic	472	503	31
North Central division	501	525	24
Eastern North Central	499	522	23
Western North Central	507	529	22
South Central division	488	514	26
Eastern South Central	485	508	23
Western South Central	491	521	30
Western division	537	579	42
Rocky Mountain	534	585	51
Basin and Plateau	508	555	47
Pacific	541	580	39

The preceding table shows that in each of the five main divisions and each of the 11 minor divisions the males are more numerous in country districts than they are in cities. The greatest difference is in the Rocky Mountain division; the least in the Southern North Atlantic states—New York, New Jersey, and Pennsylvania. The difference is greater in the South than in the North, suggesting that the influence of immigration, while not powerful enough to overcome the tendency, may reduce the differences that otherwise would be found. When the comparison between the sex distribution of the population of the cities and the country districts is carried down to the several states and territories, as in Tables XXIX and XXXI of this section, it appears that there were only two states, namely, North and South Carolina, in which the female population outside of cities having at least 2,500 inhabitants outnumbered the male population. But when attention is confined to the urban population, females were in the majority in every state east of the Mississippi and in the three Southern states west of the Mississippi, the only two southern divisions of which it was not true being Oklahoma and Indian Territory. West of the Mississippi the generalization holds true also of Iowa, Kansas, and Utah.



The two accompanying maps (Maps 16 and 17, pages 96 and 97), one for the urban and the other for the rural population, show the sex which is in the majority in each county. They have been limited to the territory in the eastern half of the country where alone the facts have enough significance to merit presentation in this form.

Considering first Map 16, it appears that north of Mason and Dixon's line in the Atlantic states and north of the southern boundary of Tennessee in the Central states there are only a few scattered counties in which the females outnumber the males in the rural population. Most of such counties are found in the agricultural area of the Southern states from Virginia to Mississippi, inclusive. Examination of a map showing the distribution of cotton growing,[1] or of one showing the counties in which negroes outnumber the whites,[2] indicates that there is a rough coincidence between the cotton belt, the black belt, and the counties in which a majority of the rural population is female. That female negroes in the United States outnumber the male has already been mentioned. That female labor, especially of negroes, is employed in agriculture in the South to a degree unparalleled in the North is well known. These facts throw some light upon the areas in which the female population is in excess in the rural districts.



Turning now to Map 17, that for urban population, one notices that north of Mason and Dixon's line and the Ohio river and east of the Mississippi river there are few large regions of contiguous counties no one of which contained any place of at least 2,500 inhabitants, with the exception of areas in northern Michigan and Wisconsin. Outside of the North Atlantic and Eastern North Central states, where the great majority of urban population is found, it is rather the exceptional county that contains any incorporated place of that size. The counties with a majority of males in their urban population lie mainly in the lumbering regions of northern New England, in the anthracite coal mining regions of eastern Pennsylvania, and the coal mining and iron working regions of western Pennsylvania and eastern Ohio. There is also a noticeable belt of such counties in a line stretching across northern Illinois to the Mississippi river and eastward into Indiana and Michigan. But notwithstanding these exceptions, the marked predominance of an excess of females in the urban population of the eastern half of the United States appears

[1] Twelfth Census, Statistical Atlas, Plate 165. [2] Map 29.

MAP 16.—COUNTIES WITH MAJORITY OF RURAL POPULATION MALE OR FEMALE: 1900.

MAP 17.—COUNTIES WITH MAJORITY OF URBAN POPULATION MALE OR FEMALE: 1900.

5734—06——7

clearly from Map 17, and the contrast between this and the excess of males in the rural population comes out from a comparison of the two maps.

The fact that in the matter of sex distribution the differences between the several states were less in 1900 than in 1890 has already been mentioned. Whether the corresponding differences between city and country are decreasing is shown by the following table:[1]

TABLE XII.—*Per cent distribution by sex of the urban and the rural population of continental United States: 1900 and 1890.*

	TOTAL POPULATION.			
	1900		1890	
	Per cent male.	Per cent female.	Per cent male.	Per cent female.
Continental United States	51.1	48.9	51.2	48.8
Cities having at least 2,500 inhabitants.	49.7	50.3	50.0	50.0
Country districts	52.0	48.0	51.9	48.1

The preceding per cents show that the difference between city and country increased for both the male and the female population, from 1.9 in 1890 to 2.3 in 1900. The absolute figures contained in Tables XXIX and XXX bring out this fact even more clearly. In the country districts in 1890 there was an excess of 1,519,559 males; in 1900 the corresponding excess was 1,840,280, so that the excess of males in the country districts of the United States increased between 1890 and 1900 by nearly a third of a million (320,721), while the excess of males in the total population of the United States (Table III, page 89) increased by only 111,833.

On the other hand, in the total population of the cities in the United States in 1890 there were 6,929 more males than females. But in 1900 in these cities there were 201,959 more females than males. Accordingly, while the excess of males in the country districts increased (1890 to 1900) by nearly a third of a million, the excess of females in the cities increased by over one-fifth of a million. These figures show clearly the increased separation of the sexes between city and country, females congregating more and more in the former and males in the latter.

To the foregoing argument it might be objected with apparent force that there were 1,861 places which had at least 2,500 inhabitants in 1900 and only 1,490 above that limit of size in 1890, and that it is illegitimate to compare the sex proportion in these two different groups. It may be conjectured in advance that the objection is more specious than substantial, because the 371 small places which entered this class between 1890 and 1900 probably had nothing like as much influence upon the figures as did the changes which went on during the same decade in the 1,490 cities, many of them large and populous. But the objection is too weighty to be put aside without examination. To meet it the comparison has been limited to the places which had at least 2,500 inhabitants in 1890 and the population of which in 1900 was known with distinction of sex. Even this method is not theoretically perfect, for it ignores the influence of changes in municipal boundaries between 1890 and 1900. But this influence may be disregarded as probably negligible in amount and certainly incalculable from the available data. The results reached by this refined method are given in Tables XXXIII and XXXIV of the present section. They show that in 1890 the cities which had at least 2,500 inhabitants at each of the last two censuses had an excess of 956 males, and that in 1900 the same cities had an excess of 223,702 females, a gain of 224,658 more females than males in the decade. By the other method the gain shown was 208,888. The country outside these cities had in 1890, 1,525,532 more males than females, and in 1900, 1,862,023, an increase of 336,491 more males than females in the decade as compared with one of 320,721 indicated by the less accurate method. The initial surmise is thus verified, since it appears that the conclusions drawn by the first method are not modified in any important way by the more refined analysis to which the figures are subjected in Tables XXXIII and XXXIV.

It was only in 1890 and 1900 that the population of all places having at least 2,500 inhabitants was given with distinction of sex, and it is only for that ten-year period, therefore, that one can get a measure of the dissociation of the sexes between city and country and of its increase.

This dissociation is characteristic of the civilization of western Europe and of the countries into which it has expanded. The explanation usually offered for it is the greater demand for female labor in cities, especially in domestic service, and the greater demand for male labor in country districts, especially in agriculture. There is no doubt that this fact explains most of the difference revealed by the figures. Whether it is a complete explanation may be indicated by ascertaining whether the excess of females in the cities and of males in the country districts appears only at and after the age at which the individual becomes self-supporting. To get light upon this fact the figures for sex may be combined with those for age. The age classification of the population of the United States has been carried for the last two censuses only for the several states and territories and for the cities having at least 25,000 inhabitants. In introducing this refinement of analysis it is necessary, therefore, to draw the line between city and country population at 25,000 instead of 2,500, and thus to class with the truly rural districts nearly 11,000,000 persons living in places of between 2,500 and 25,000 inhabitants. But as these constitute less than one-fifth of the entire population living outside of cities having at least 25,000 inhabitants, it is probable that what is true of the latter class would hold true also for the really rural population.

The results of this analysis of sex in combination with age are shown in Table XXXV of this section. In 1900 among children under 5 years of age living in cities of

[1] For detailed figures see Tables XXIX–XXXII of this section.

at least 25,000 inhabitants, 503 in 1,000 were male; among children of the same age living outside of these cities, 506 were male. Inspection of this table shows that in 37 states and territories the child population could be thus analyzed. In nearly three-fourths of these (27 of the 37) the proportion of male children without the large cities was greater than that within them. This smaller proportion of male children in cities is found in each of the five great divisions of the country except the Western and in all the eight minor divisions east of the Rocky mountains except New England. These facts indicate that minor influences probably cooperate with that of migration to establish the marked excess of females in the urban population of all ages and that some at least of these influences act upon young children.

Among the population exclusive of infants under 5 years of age, 33 states and territories out of 37 have a smaller proportion of males in the cities than outside of them; 23 of 37 have an actual excess of females in the large cities, while only 4 of the 49 have an actual excess of females outside of the large cities.

At the censuses of Rhode Island and Massachusetts in 1895 the age and sex classification of the population was tabulated and published for all towns and cities, and it is therefore possible to give for those states in 1895 the per cent of males among children in the urban and the rural districts. The number of children living in Rhode Island in places of less than 2,500 inhabitants is so small that a per cent based upon them would be untrustworthy. For this reason the Rhode Island figures have been combined with those of Massachusetts. In the rural districts of these two states 50.8 per cent of the children under 5 years of age were male and 49.2 per cent female, while in the towns having at least 2,500 inhabitants only 50.2 per cent were male and 49.8 per cent female.[1] The Michigan census of 1894 makes it possible to get comparable results for that state. In the incorporated places having at least 2,500 inhabitants, among children under 5 years of age, 50.8 per cent were male and 49.2 per cent female. In the rest of the state among the children 51.3 per cent were male and 48.7 per cent female.[2]

The figures from these states indicate that where it is possible to carry the analysis down to the lowest limit of population employed by the Federal census as a dividing line between city and country there is a larger proportion of male children in the country districts than in the cities and towns. Whether these facts point to a larger proportion of male births in the country districts, as is sometimes alleged, the figures at hand do not enable one to judge. The inference is warranted, however, that the proportion of males among young children in the rural districts in the United States is slightly higher than in the cities and towns, and that this is one cause, although a minor one, in explaining the preponderance of females in cities and of males in the country districts.

In Table XIII the 160 cities having at least 25,000 inhabitants in 1900 are arranged in the order of decreasing per cent of male population. The figures on which the per cents are based may be found in Table XXVIII of this section.

TABLE XIII.—*Cities having at least 25,000 inhabitants, in order of decreasing per cent male in total population: 1900.*

[1] The figures were: In the rural districts of Massachusetts and Rhode Island, total children under 5 years of age, 20,664; male, 10,506; female, 10,158. In places having at least 2,500 inhabitants, total children under 5 years of age, 252,197; male, 126,626; female, 125,571.

[2] The figures were: In the rural districts of Michigan, total children under 5 years of age, 166,963; male, 85,594; female, 81,369. In places having at least 2,500 inhabitants, total children under 5 years of age, 97,016; male, 49,237; female, 47,779.

That the prevailing occupations have a very important influence upon the distribution of the sexes is strikingly illustrated by the diverse proportions in the adjacent cities of Troy and Schenectady, N. Y. Troy is engaged very largely in the manufacture of collars and cuffs, an industry that employs, in the main, female help. Probably in consequence of this fact there are only four cities in the United States in which the proportion of females in population is greater than it is in Troy. Schenectady, on the other hand, owes its recent rapid growth very largely to the electrical industry. In that industry the wage-earners are mainly men. In consequence, Schenectady has a larger proportion of males in its population than in any other city east of the Mississippi river except Superior and East St. Louis.

The table also suggests that the demand and supply of domestic service is, perhaps, the most important single factor in dissociating the sexes. This is illustrated by the fact that the three cities with the largest proportion of females in their population are Newton, Mass. (552 per thousand); Charleston, S. C. (541 per thousand); and Montgomery, Ala. (540 per thousand). These three cities, especially the first, are primarily well to do residential centers and less notable for manufacturing or trade. The large number of southern cities with a very high proportion of females in their population appears clearly in Table XIII. Of the entire list less than one-fifth (29 of 160) are in the South, but of the 20 with largest per cent of females half are in the South.

SEX AND AGE.

As there were nearly one and two-thirds million more males than females of all ages in continental United States,[1] it naturally would be expected that there would be more males than females at each age. That this is not the case appears from Table XIV, which shows the proportion of males and females in each 1,000 of the total population of the specified age.[2]

Table XIV shows that notwithstanding the marked excess of males in the entire population there are two periods of life—namely, from 15 to 24 and from 80 to the close of life—in which the reported females are more numerous than the males.

A more exact statement regarding the ages at which the number of females exceeds that of males may be derived from Twelfth Census, Volume II, Table XVI, page xxxvi. This shows that in continental United States the females at the ages of 16 to 25 (except 21), 70, 75, 80, 82, and 84 to the end of life were more numerous than the males of corresponding age. The greater number of females reported at ages over 83 may be accepted as correct and explained by the greater longevity of the female population. The greater number of females at the ages of 70, 75, and 80 is due probably to the greater concentration on round numbers on the part of aged women in stating their ages.

[1] Table III, page 89.

[2] For figures from which these proportions have been computed, see Twelfth Census, Abstract, Table 11.

TABLE XIV.—*Number of males and females in 1,000 of each specified age group of the population of continental United States: 1900.*

QUINQUENNIAL AGE PERIOD.	NUMBER IN EACH 1,000 POPULATION: 1900.		EXCESS OF—	
	Males.	Females.	Males.	Females.

90 to 94 years	411	589	.....	178
95 to 99 years	386	614	.....	228
100 years and over	363	637	.....	274
Age unknown	635	365	270	.....

Whether this concentration was greater also on the part of women under 70 years of age can not be determined from these figures. It may have been, and yet not sufficiently so to make the reported number of women greater than that of men. To compare the sexes in this respect a measure of concentration is needed. It may be found by the following method: Subtract from the number of persons reported at each multiple of 5 one-fifth of the total number of persons reported for the five-year period of which the multiple of 5 is the middle year. The remainder is the estimated number whose age was reported erroneously at the multiple of 5. This would vary with the total population reporting and with the degree of inaccuracy. By computing the per cent it makes of the total number in the five-year period the former cause of variation is eliminated and the result is an approximate measure of concentration on round numbers.

The results reached by this comparison between the sexes for continental United States are stated, as follows:[3]

ROUND NUMBER.	MEASURE OF CONCENTRATION ON SPECIFIED ROUND NUMBER IN AGE RETURNS.	
	For males.	For females.
25	1.1	1.4
30	4.7	4.3
35	3.0	2.5
40	5.2	5.0
45	4.5	3.9
50	6.4	7.0
55	3.3	3.6
60	7.7	8.7
65	3.2	4.2
70	5.7	7.4
75	3.4	4.7
80	4.6	7.1
85	1.3	5.8
90	4.6	8.5

[3] For figures from which the computation has been made, see Twelfth Census, Vol. II, Table XVI.

The preceding statement shows that at the ages of 30, 35, 40, and 45 erroneous replies, as indicated by concentration on round numbers, are more common among males than among females; that at the ages of 25, and of 50 and over, the concentration on round numbers is more marked in the case of females; and that the difference between the sexes increases with advancing age.

As contributing to explain this greater concentration on round numbers in the statements of the ages of men 30 to 45 years of age, it may be mentioned that the enumerators, who visit the houses mainly during the working hours, are met and answered by women more commonly than by men. In consequence the proportion of men of working age, whose ages are reported by other persons than themselves, must be greater than the proportion of women. As to the general rule that erroneous answers to the age question are made more often by women, it may be noted that errors are made in larger proportion by illiterates than by persons possessing the rudiments of education, and the female sex is more illiterate than the male. Perhaps a larger proportion of women are unwilling to state their age. In such cases either the incorrect answers received or the estimated age entered by the enumerators would be probably a multiple of five.

But neither the greater longevity of women nor the greater tendency to state their ages in round numbers can be used to explain the greater number of women between 16 and 25 years of age. It is most improbable that when the reported number of persons in the country between 6 and 15 years of age at any one census shows, as it uniformly does, a decided excess of males, the survivors of this group ten years later, namely, those reported as from 16 to 25 years of age at the following census, should really have a decided excess of females, or that the immigrants of that age coming into the country should be so predominantly female as to explain the difference. About 54 per cent of the immigrants of all ages are male. The only tenable explanation of the excess of females at ages 16 to 25 is that it is an error. It may arise from a tendency on the part of men 16 to 25 years of age to state their age as below or above those years, or from a tendency on the part of women or girls not of those ages to return their age between those limits or from both. The first hypothesis is improbable, and the best explanation is that a certain number of women not between 16 and 25 years old report themselves at ages between those limits. The probable reason is that many women prefer to pass as at the age at which marriage is most common. It has been pointed out in the English census that there is an excess in the reported number of English women 21 to 25 years of age.[1] In Cuba it was found by the census of 1899 that there was a decided excess in the number of women 15 to 19 years of age, and that this was much more marked at the ages 15 to 17 than for the ages 18 and 19.[2] The difference between results in England and those in Cuba may be connected with the later average age at which women marry in England. The explanation suggested is supported somewhat by the facts that among the non-Caucasian population of the United States, over nineteen-twentieths of which is negro, and in which the males for all ages outnumber the females, the excess of females appears as early as the age of 14, and is maintained for every age except that of 21 years from 14 to 26, inclusive, while among the white population the excess of females does not manifest itself until the age of 18 is reached. One may perhaps note an ascending scale in this particular roughly connected with the age of marriage. The excess of females among the total colored begins at the age of 14; that among the native white of foreign born parents, at the age of 15; that among the foreign born white (notwithstanding the marked excess of males in the total foreign born white of all ages), at the age of 16; and that among the native white of native parents, at the age of 18.

SEX AND RACE.

Of the four great races in the United States—white, negro, Indian, and Mongolian—each except the negro has an excess of males.[3] With Mongolians and whites this is due mainly if not entirely to immigration, but the number of immigrant Indians is so small—less than 1 per cent of the entire number in the country—that the excess of male Indians can hardly be ascribed to that cause. If attempt be made to exclude its influence by confining attention in each case to the natives, it appears that among native whites, native Indians, and native Mongolians, there is an excess of males.[4] But among the 9,010 Chinese reported as born in this country nearly three-fourths (73.9 per cent) were reported as male. This is an incredible proportion. Either the sex or the birthplace has been erroneously reported, or if correctly reported, erroneously tabulated. That the former is the more probable hypothesis is indicated by the fact that in one case in which 202 errors in the ultimate results were traced to ascertain their source it was found that 181 or about nine-tenths were made in the enumeration and 21 or only about one-tenth were made in course of tabulation.[5] This a priori probability is confirmed by evidence to be presented later (page 102), that many foreign born Chinese in the United States have a strong motive for reporting themselves as native. It is likely, therefore, that the errors thus revealed in the results were errors made in the enumeration and not errors made in the office. In reporting nativity there seems to be more chance of error than in reporting sex. If it be assumed that the errors which certainly exist were made by the enumerators in reporting nativity, then several thousand male Chinese really born abroad were reported as natives of the United States. If this be accepted, some clew to

[3] Twelfth Census, Abstract, Table 3.
[4] Twelfth Census, Abstract, Table 5.
[5] "Note on American Census Practice" in Journal of the Royal Statistical Society, Vol. LXIV, page 529 (September, 1901).

the magnitude of the error may be found by aid of two assumptions: (1) That the true number of Chinese born in the United States and remaining alive and in this country until June, 1900, was equally divided between the two sexes. (2) That the tendency to report foreign born Chinese as native applied equally to each sex. On these assumptions the number and per cent of errors in reporting the nativity of the Chinese are easily computed. The former is found to be 4,548 and the latter 5.3.[1]

A satisfactory explanation of these erroneous figures is found in the last report of the Commissioner of Immigration. He shows that perhaps the most important way which Chinese immigrants have devised for evading the exclusion laws is for the foreigner to enter the country from Canada or Mexico, submit to arrest for violation of the law, and on trial to present Chinese testimony that he was born in the United States and is thus by birthright a citizen to whom the exclusion law has no application. A special report on the subject to the Commissioner of Immigration in 1903 says: "By this method thousands of Chinese—upon the admission of the Chinese themselves—have been allowed not only to enter and remain in the United States, but declared to be native born citizens thereof, each with a vote and qualified to participate in the political affairs of this country."

This is doubtless the true explanation of the incredible figures of the census. Many Chinese immigrants, knowing that it would be to their advantage to pass as native Americans, falsely reported themselves as born in the United States.

The foregoing indications that a considerable proportion of Chinese born abroad were erroneously returned as born in the United States suggest that a similar explanation may account for the excess of males in the native white population. It is a noteworthy fact shown in the following table that at each census for which the information has been reported the males outnumbered the females in the native white population of the United States.

TABLE XV.—*Native white population of continental United States, classified by sex: 1850 to 1900.*

CENSUS.	NATIVE WHITE POPULATION.					
	Total.	Male.	Female.	Excess of males.	Per cent male.	Per cent female.
1900	56,595,379	28,686,450	27,908,929	777,521	50.7	49.3
1890	45,862,023	23,254,474	22,607,549	646,925	50.7	49.3
1880	36,843,291	18,609,265	18,234,026	375,239	50.5	49.5
1870	28,095,665	14,086,509	14,009,156	77,353	50.1	49.9
1860	22,869,805	11,643,081	11,226,724	416,357	50.9	49.1
1850	17,279,875	8,765,352	8,514,523	250,829	50.7	49.3

If the census returns on this point may be accepted as correct, Table XV indicates that among the native white population the males have decidedly outnumbered the females for half a century. Even the decimation of the male population by the Civil War was insufficient to bring the number of native white males in 1870 down to that of the native white females, and since that date the excess of males has apparently increased until in 1900 it was in absolute numbers ten times as great as in 1870 and far greater than ever before and relative to population greater than at any previous census except that of 1860.

The present writer in analyzing the figures of previous censuses on this subject reached the following conclusion in 1899: "It seems probable that a certain number of foreign born residents were reported as natives, and that this was more common among males than among females, either because they were more numerous, less informed, or less veracious, or because they were less likely to be seen personally by the enumerators. * * * This tendency to call oneself a

[1] The following solution of this interesting mathematical problem has been kindly furnished by Professor James McMahon, of Cornell University. The numerical data will be found in Twelfth Census, Abstract, Tables 3, 4, and 5. Let F = true number of foreign born Chinese in the United States in 1900; N = the true number of Chinese native of and resident in the United States in 1900; r = the per cent of F who falsely claimed nativity; and n = the per cent of females in F. Then from the census figures, by aid of the two assumptions already given, the following four equations may be written down:

(1) $F+N=89{,}863$, the number of resident Chinese;

(2) $F\times\frac{r}{100}+N=9{,}010$, the number claiming nativity;

(3) $F\times\frac{n}{100}+\frac{N}{2}=4{,}522$, the number of female residents;

(4) $\left(F\times\frac{n}{100}\right)\frac{r}{100}+\frac{N}{2}=2{,}353$, the number of females claiming nativity.

By subtracting (2) from (1) and (4) from (3) we have

(5) $F\left(1-\frac{r}{100}\right)=80{,}853$;

(6) $\left(F\times\frac{n}{100}\right)\left(1-\frac{r}{100}\right)=2{,}169$;

and dividing (6) by (5)

$$n=2.68.$$

Multiplying (3) by two and subtracting the product from (1) gives

(7) $F-\frac{Fn}{50}=80.82$.

Whence

$$F=85{,}401,$$
$$N=4{,}462,$$
$$r=5.325,$$

and the total number of foreign born Chinese who were erroneously returned by the census enumerators as natives of the United States was 4,548, of whom 4,426 were males and 122 were females.

native apparently increases with age and the progressive Americanization it involves."[1]

The new evidence brought to light by the figures for the Twelfth Census corroborates the conclusions reached at that time. Notwithstanding the prima facie evidence of the figures, one can not affirm with confidence that there is any tendency to an excess of males in the native white any more than there is in the native Chinese population of the United States. The negroes and the Indians, the two races practically unaffected by migration, are the only ones about which the census returns on this point may be deemed trustworthy. Among them, as already indicated, we find an excess of females among the negroes and of males among the Indians.

SEX AND SCHOOL ATTENDANCE.

In 1900 there were 13,367,147 persons reported as attending school in continental United States. Of these 6,668,823 were male and 6,698,324 were female.[2] These figures show that among each 1,000 persons of all ages in school, 499 were male and 501 were female, a slight excess of females. The difference between the two sexes in 1900 was so slight as to be insignificant, but the trend of change during the preceding ten years and therefore the probable direction of the present movement are more important. In 1890 there were 11,674,878 persons in school, of whom 5,954,142 were male and 5,720,736 were female.[3] In other words, at that date, 510 persons out of every 1,000 attending school were male and 490 were female. In 1890, therefore, among each 1,000 persons in school there were 20 more males than females; in 1900, in a group of the same size, there were 2 more females than males. Or, stating the same change in terms of increase, the male school population increased from 1890 to 1900 by 12.0 per cent; the female by 17.1 per cent.

This change seems important enough to deserve more detailed analysis. In 1890 an excess of males among persons in school was found in each of the five main divisions of continental United States. Indeed, at that date there were, besides the District of Columbia, only four states, Virginia, South Carolina, Georgia, and Nevada, in which the female school population outnumbered the male.[4] By 1900 the number of such states and territories had increased to 27.[5] Their location appears on the following map:

[1] American Economic Association, New Series, No. 2, "The Federal Census, Critical Essays by Members of the American Economic Association," page 17.
[2] Twelfth Census, Abstract, Table 16.
[3] Eleventh Census, Population, Part II, page xxvii.
[4] Eleventh Census, Population, Part II, Table 18.
[5] Twelfth Census, Abstract, Table 56.

MAP 18.—*States and territories having an excess of females in the population attending school: 1900.*

This map shows that in every Southern state except West Virginia, Kentucky, and Oklahoma the female school population outnumbers the male; that in five North Atlantic states, including the four most populous ones, the same is true; and that the largest area with excess of males in its school population is in the North Central group.

This decrease between 1890 and 1900 in the proportion of males among persons in school applies to all distinguishable races.

TABLE XVI.—*Proportion of males in the school population of continental United States, classified by race: 1900 and 1890.*

RACE.	MALES IN EACH 1,000 PERSONS ATTENDING SCHOOL.		
	1900	1890	Decrease: 1890 to 1900.
White	502	512	10
Negro	465	485	20
Indian and Mongolian	532	568	36

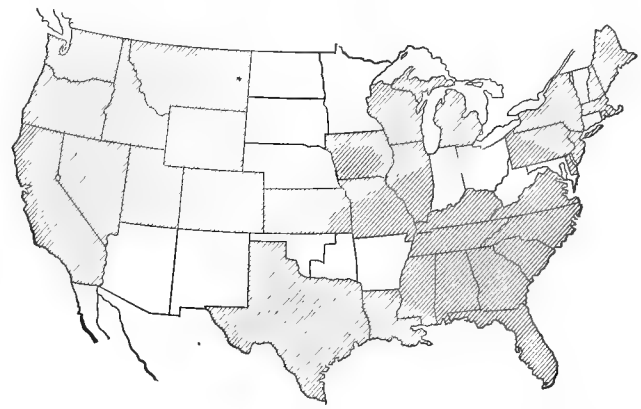
The decrease appears in each of the three classes, but it has been much greater among negroes, Indians, and Mongolians than among whites.

These figures show that among whites there were 4 more males than females in each 1,000 persons in school in 1900, and that the slight excess of females in the school population of all classes is due to the great excess of females in the negro school population counterbalancing the slight excess of males among the white school population and the great excess of males among the Indian and Mongolian school population. Among 1,000 negroes attending school there are 70 more females than males. It is possible that this may be a geographical rather than a racial difference; in other words, the excess of females might be characteristic of the South

rather than of the negro. To test this the white school population has been divided into northern and southern; the result shows practically no geographic difference within that race. Among 1,000 whites attending school in the North 502 are male; among 1,000 in the South 504 are male. The tendency to an increased proportion of females is equally marked in each section, the proportion of males having fallen in the South from 514 in 1890 to 504 in 1900 and in the North from 512 in 1890 to 502 in 1900. The difference then is not merely geographical. Among 1,000 negroes attending school the females are in excess by 70; among 1,000 southern whites attending school the males are in excess by 8.

The decrease in the proportion of males in school, which is true of all races, is true also of the four age classes for which comparable returns for 1890 and 1900 are to be had. This is shown by Table XVII.

TABLE XVII.—*Proportion of males in the school population of continental United States, classified by age periods: 1900 and 1890.*



AGE PERIOD.	MALES IN EACH 1,000 PERSONS ATTENDING SCHOOL.		
	1900	1890	Decrease: 1890 to 1900.
All ages	499	510	11
Under 5 years	502	510	8
5 to 9 years	505	507	2
10 to 14 years	498	505	7
15 years and over	490	528	38

These figures indicate that up to the age of 10 years more boys than girls are in school. But the slight difference is no more than can be explained by the fact that in each 1,000 children 5 to 9 years old there are 10 more boys than girls. The notable decrease between 1890 and 1900 in the proportion of males among school children is due mainly to the disproportionate increase of school girls 15 years old or more. In 1890 in each 1,000 persons of this age period in school there were 56 more boys than girls; in 1900 the sex proportion had so changed that there were 20 more girls than boys.

To show the almost complete universality of this change in the sex composition of the population at least 15 years of age attending school, Table XXXVIII has been prepared.

If persons of this age attending school may be regarded as receiving what may be loosely termed higher education, then the number of young men receiving higher education increased, 1890 to 1900, 3.7 per cent and the number of young women increased during the same decade 20.5 per cent. In several states, especially of the Western division, the change in the per cent of females was very great—New Mexico, 7.5; Idaho, 6.3; Iowa, 6.2; Washington, 6.1. In the following map the states in which more than half the persons seeking higher education by attending school after the age of 15 were women, are indicated by hatching.

MAP 19.—*States and territories having an excess of females in the population at least 15 years of age attending school: 1900.*

The summary of results of Table XXXVIII, by main geographic divisions, shows the following figures:

DIVISION.	MALES IN EACH 1,000 PERSONS AT LEAST 15 YEARS OF AGE ATTENDING SCHOOL.		
	1900	1890	Decrease: 1890 to 1900.
Continental United States	490	528	38
North Atlantic division	481	512	31
South Atlantic division	478	505	27
North Central division	500	545	45
South Central division	493	524	31
Western division	478	520	42

The greatest decrease in the proportion of males among those pursuing what may roughly be termed higher education was in the North Central division, which is the one in which the proportion of males in 1890 was greatest. The net result of all the changes was to reduce the difference between the extremes in 1900 to little more than half that in 1890. The detailed figures for the minor divisions and the states and territories of continental United States will be found in Table XXXVIII. It shows that in all but four of the states and territories—District of Columbia, Oklahoma, Arizona, and Nevada—the proportion of males among persons at least 15 years of age attending school was less, and in most cases much less, in 1900 than in 1890.

The tables of the Eleventh and Twelfth censuses make it possible to carry the analysis one step farther by distinguishing the sex of school attendants in cities having at least 25,000 inhabitants and in the rest of the country. The following table summarizes the results:

TABLE XVIII.—POPULATION AT LEAST 15 YEARS OF AGE ATTENDING SCHOOL DURING THE CENSUS YEAR, CLASSIFIED BY SEX, AND PER CENT DISTRIBUTION BY SEX, IN CITIES HAVING AT LEAST 25,000 INHABITANTS AND SMALLER CITIES OR COUNTRY DISTRICTS: 1900 AND 1890.

	POPULATION AT LEAST 15 YEARS OF AGE ATTENDING SCHOOL DURING THE CENSUS YEAR.									
	1900			1890			Per cent male.		Per cent female.	
	Total.	Male.	Female.	Total.	Male.	Female.	1900	1890	1900	1890
Continental United States	2,605,426	1,276,810	1,328,616	2,333,146	1,230,853	1,102,293	49.0	52.8	51.0	47.2
Cities having at least 25,000 inhabitants	434,465	205,774	228,691	275,935	129,502	146,433	47.4	46.9	52.6	53.1
Smaller cities or country districts	2,170,961	1,071,036	1,099,925	2,057,211	1,101,351	955,860	49.3	53.5	50.7	46.5

The table shows that the per cent of males among the older scholars in large cities has slightly increased, but that outside of the cities it has greatly decreased. The difference between city and country in this respect in 1900 (1.9 per cent) was less than one-third of what it was in 1890 (6.6 per cent). The great change therefore is one that has been at work outside of the large cities, but not in them.

To determine whether this change has occurred in all parts of the country, the analysis has been made for each of the five main divisions.

DIVISION.	MALES IN EACH 1,000 PERSONS AT LEAST 15 YEARS OF AGE ATTENDING SCHOOL.					
	In cities having at least 25,000 inhabitants.		In smaller cities or country districts.		Increase (+) or decrease (−) in ten years.	
					In cities having at least 25,000 inhabitants.	In smaller cities or country districts.
	1900	1890	1900	1890		
Continental United States	474	469	493	535	+ 5	−42
North Atlantic division	487	484	477	522	+ 3	−45
South Atlantic division	451	440	480	511	+11	−31
North Central division	473	468	504	552	+ 5	−48
South Central division	441	422	496	528	+19	−32
Western division	448	462	486	531	−14	−45

In each of the five divisions except the Western the proportion of males among the older scholars in the large cities increased between 1890 and 1900, while outside the large cities the proportion of males decreased in every division. Only in the smaller cities or country districts of the North Central states do the males outnumber the females among the persons at least 15 years of age attending school.

The figures indicate that in this matter conditions outside of the large cities, during the decade from 1890 to 1900, have been rapidly approaching those within them.

The decreasing proportion of males among persons in school, and the fact that they now constitute a minority of the school population, may be further illustrated by comparing the number of either sex in school with the number of the same sex and of age to attend school. This may be done by dividing the number 5 to 20 years of age in school by the total number of persons 5 to 20 years of age inclusive.

Among male children the per cent attending school in 1900 (50.2) was slightly less than that among female children (50.9). One reason for this slight difference is suggested by the following table:

TABLE XIX.—*Per cent attending school in the population of continental United States of each sex in specified age period: 1900.*[1]

AGE PERIOD.	PER CENT ATTENDING SCHOOL OF TOTAL POPULATION IN SPECIFIED AGE PERIOD: 1900.	
	Male.	Female.
5 to 20 years	50.2	50.9
5 to 9 years	48.1	48.1
10 to 14 years	78.8	81.0
15 to 17 years	39.7	44.0
18 to 20 years	12.1	11.2

[1] The figures on which these per cents are based may be found in Twelfth Census, Abstract, Tables 14 and 15.

At ages below 10 the proportion of boys and of girls attending school is the same, from 10 to 17 the proportion of girls is larger, and from 18 to 20 the proportion of boys is larger. The explanation probably is that at ages when earning money is possible the proportion of boys kept from school for that purpose is rather greater than the proportion of girls. But of those boys who attend school a larger proportion go on to get a higher education in order to fit themselves for a more remunerative occupation. This explanation derives some support from an examination of the numbers attending school after reaching the age of 21 years. The males of voting age reported as attending school were 11.3 per cent as many as the males 15 to 17 years of age attending school. The females at least 21 years of age reported as attending school were only 5.9 per cent as many as the females 15 to 17 years of age attending school. The slightly larger proportion of girls of all ages in school is due, then, to the fact that a larger proportion of them remain in school after the age at which the earning of money usually begins, offset partly, but not entirely, by the larger proportion of boys who go on to some form of higher education involving school attendance after the age of 18 is passed.

In Table xx the computation has been extended to the two main races in the United States, the white and the negro:

TABLE XX.—*Per cent attending school in the white and the negro population of continental United States of each sex in each specified age period: 1900.*[1]

AGE PERIOD.	PER CENT ATTENDING SCHOOL OF TOTAL POPULATION IN SPECIFIED AGE PERIOD: 1900.			
	White.		Negro.	
	Male.	Female.	Male.	Female.
5 to 20 years	53.4	53.9	29.2	32.7
5 to 9 years	52.0	51.9	23.2	24.2
10 to 14 years	83.2	84.8	50.6	57.0
15 to 17 years	42.0	45.7	23.8	32.9
18 to 20 years	13.0	11.8	6.2	7.8

[1] The figures on which these per cents are based may be found in Twelfth Census, Vol. II, Tables XVI and LI.

These figures show that the difference between the sexes in the per cent of children 5 to 20 years of age attending school was slightly less for the whites and much greater for the negroes than the average for the entire population. The differences between the sexes among whites correspond closely to those for the entire population, but among negro children at each age the per cent of girls attending school is larger than that of boys. The difference with children under 10 years of age is comparatively slight, but above that age it is marked. Among children 15 to 17 years of age, for example, less than one-fourth of the negro boys are attending school, while nearly one-third of the negro girls were thus reported.

The analysis may be carried one step farther by discriminating between native white and foreign born white, as is done in the following table:

TABLE XXI.—*Per cent attending school in the native and the foreign born white population of continental United States of each sex in each specified age period: 1900.*[1]

AGE PERIOD.	PER CENT ATTENDING SCHOOL OF TOTAL POPULATION IN SPECIFIED AGE PERIOD: 1900.			
	Native white.		Foreign born white.	
	Male.	Female.	Male.	Female.
5 to 20 years	54.6	55.2	32.2	30.1
5 to 9 years	51.9	51.8	58.4	57.9
10 to 14 years	83.7	85.4	73.4	72.6
15 to 17 years	43.9	48.1	16.4	15.8
18 to 20 years	14.3	13.1	2.9	2.4

[1] The figures on which these per cents are based may be found in Twelfth Census, Vol. II, Tables XVI and LI.

Here, again, the figures for the native white agree in the main with those for the entire population and the white population. But among the immigrant white population, by a noticeable anomaly, the proportion of children in school is greater for boys than for girls, and this holds for every age. Whether the fact is due to the greater demand for the labor of girls in the North and in cities where immigrants are most numerous, or is due to the more crying need of Americanization on the part of foreign born boys, who in later years will more inevitably be subject to the competitive struggle for a place and for advancement in the industrial system, can not be learned from the figures.

The age classification in the statistics of school attendance in 1890 differed from that employed in 1900. Consequently, in the following table only the first two age periods are comparable with those in the preceding tables:

TABLE XXII.—*Per cent attending school in the population of continental United States of each sex in each specified age period: 1890.*[1]

AGE PERIOD.	PER CENT ATTENDING SCHOOL OF TOTAL POPULATION IN SPECIFIED AGE PERIOD: 1890.	
	Male.	Female.
5 to 19 years	54.7	53.8
5 to 9 years	49.3	49.1
10 to 14 years	79.2	80.3
15 to 19 years	34.2	31.5

[1] The figures on which these per cents are based may be found in Eleventh Census, Population, Part II, Tables 1 and 10.

In 1890 the proportion of male children 5 to 19 years of age attending school was slightly greater than the proportion of female children of the same age; in 1900, as already shown, the reverse was true of the age period 5 to 20. The difference may be due entirely, as it certainly was partly, to the fact that in 1900 relatively fewer boys and more girls 10 to 14 years of age were reported as in school.

Some further light is thrown on the situation by carrying together the age and the race classification. In doing so, however, it is necessary to combine the figures for negroes with those for Indians and Mongolians, the reason being that in 1890 the age classification was not reported for the negroes alone. In computing the per cents it has been assumed that all persons attending school were less than 25 years of age.

TABLE XXIII.—*Per cent attending school, in the total, the white, and the negro, Indian, and Mongolian population of continental United States of both sexes, and of each sex in each specified age period: 1900 and 1890.*[1]

RACE AND AGE.	PER CENT ATTENDING SCHOOL OF TOTAL POPULATION OF SPECIFIED RACE, SEX, AND AGE.					
	Total.		Male.		Female.

[1] For absolute figures see Table XXXIX.

The preceding table shows that the decrease between 1890 and 1900 in the per cent of population 5 to 24 years of age attending school applied to both races but not to both sexes, there being no decrease for the total female or the white female population and only a very slight decrease for the non-Caucasian female. For the age period 5 to 9 there was a slight decrease for each race and sex; for the age period 10 to 14 there was a slight increase for the total, which was the resultant of a slight decrease among whites and a decided increase among non-Caucasians. The decrease among whites 10 to 14 resulted from a decrease of 11 per 1,000 among white males and 1 per 1,000 among white females. The decided increase among non-Caucasians was due to an increase of 10 per 1,000 among males and 35 per 1,000 among females. For the age period 15 to 24 there was a decrease for each race, the decrease for whites being the resultant of a decrease of 21 per 1,000 among males and an increase of 6 per 1,000 among females, and the decrease for non-Caucasians being the resultant of a decrease of 16 per 1,000 among males and no change among females.

All available evidence points to the conclusions that the tendency to seek an education and especially a higher education through school attendance is stronger with girls than with boys, that this difference pervades nearly all distinguishable areas and quite all distinguishable classes, and that it is producing a slight increase in the proportion of females attending school at all ages and a decided increase in the proportion among those at least 15 years of age.

SEX AND DEATH RATE.

The only trustworthy information regarding the death rate of the sexes in the United States, obtained at the Twelfth Census, is derived from figures for the registration area, which included in 1900 a population of 28,807,269, or 37.9 per cent of the population of continental United States. This area included 14,393,332 males, among whom, during the census year, 272,819 deaths were reported, indicating a death rate for males of 19 per 1,000. In the same area there resided 14,413,937 females, among whom, in the census year, 239,850 deaths were reported, showing a death rate for females of 16.6 per 1,000. These figures indicate that the death rate of males in the registration area, and therefore probably in the entire United States, was about one-seventh higher than that of females, a difference which corresponds closely with that between the death rates of the two sexes in most of the countries of Europe.

The following table shows the population, deaths, and death rates, with distinction of sex, for the registration cities—that is, the 346 cities having at least 8,000 inhabitants for which the registration of deaths under local laws and ordinances was found to be sufficiently accurate for use by the Census Office—and also for the rest of the registration area.

TABLE XXIV.—*Population, deaths, and death rate per 1,000 for each sex in the 346 registration cities and in the rest of the registration area: 1900.*

	POPULATION: 1900.		DEATHS: 1900.		DEATH RATE: 1900.	
	Male.	Female.	Male.	Female.	Male.	Female.
346 registration cities...	10,743,374	10,917,257	215,115	187,551	20.0	17.2
Rest of registration area.	3,649,958	3,496,680	57,704	52,299	15.8	15.0

In the registration cities the male death rate exceeds the female by 2.8 per 1,000, while in the registration area outside of these cities the male death rate is in excess by only 0.8 per 1,000. In the cities the male death rate is to the female as 116 to 100; outside the cities the ratio is only 105 to 100. This marked difference in the ratio of the death rate of the two sexes in city and country is probably not compensated by an equivalent difference in the ratio of the birth rates of the two sexes. If so, it probably contributes to maintain the large and growing excess of females in cities and of males in country districts already revealed by the figures.

Some additional light is thrown upon this difference by considering the influence of age as well as that of sex. Results are shown in the following table:

TABLE XXV.—POPULATION, DEATHS, AND DEATH RATE PER 1,000 IN THE REGISTRATION AREA, BY SEX AND AGE PERIODS: 1900.

AGE PERIOD.	POPULATION: 1900.			DEATHS: 1900.			DEATH RATE: 1900.			
	Total.	Male.	Female.	Total.	Male.	Female.	Total.	Male.	Female.	Ratio of male death rate to female death rate=100.
The registration area:										
Under 1 year	617,918	311,672	306,246	102,220	57,251	44,969	165.4	183.7	146.8	125

45 to 64 years	4,309,590	2,174,131	2,135,459	95,303	52,483	42,820	22.1	24.1	20.1	120
65 years and over	1,267,355	597,890	669,465	109,781	54,479	55,302	86.6	91.1	82.6	110

Table xxv shows that for each age period for which the Census Office has returns, the death rate for males is decidedly higher than that for females. The last column of the table shows, however, that this difference is least at the ages of 5 to 14, greatest during the first year of life, and increases with the remoteness of the age period in either direction from the minimum at 5 to 14.

The census figures do not allow any classification by sex and smaller age groups, but those for Massachusetts and for certain foreign countries have been made the basis for the construction of life tables showing the death rate by sex for each year of age.

Typical results of these compilations appear in the following table, showing the death rate for males and females at each year of age, taken from a recent life table of Massachusetts prepared by the secretary of the state board of health, from the last English life table, from a Norwegian, and from a Prussian life table:

TABLE XXVI.—DEATH RATE PER 100,000 FOR MALES AND FEMALES, CLASSIFIED BY SINGLE YEARS OF AGE IN MASSACHUSETTS, ENGLAND AND WALES, PRUSSIA, AND NORWAY, BASED ON THE MORTALITY AT THE DATES SPECIFIED.

YEAR OF AGE.	Massachusetts: 1893 to 1897.		England and Wales: 1881 to 1890.		Prussia: 1867, 1868, 1872, and 1875 to 1877.		Norway: 1881–82 to 1891–92.		YEAR OF AGE.	Massachusetts: 1893 to 1897.		England and Wales: 1881 to 1890.		Prussia: 1867, 1868, 1872, and 1875 to 1877.		Norway: 1881–82 to 1891–92.

The preceding table suggests certain inferences:

1. The differences between the death rates of males and females are much affected by age.

2. The differences are not uniform in the different countries.

3. Male children under three years of age have uniformly a higher death rate than female children of corresponding age.

4. In England and Wales the male death rate is higher than the female except for the eight years, 14 to 21, inclusive.

5. In Massachusetts the male death rate is higher than the female except for the seventeen years, 5 to 21, inclusive.

6. In Prussia and Norway there are two main periods of life in which the females have a higher death rate; in Prussia these periods are 8 to 16 and 30 to 34; in Norway they are 5 to 15 and 32 to 41, inclusive.

7. In all four countries the death rate of women between 20 and 30 years of age and so at the age when probably the majority of the children are born is almost uniformly below that of men of the same age. The perils of childbirth, therefore, are not so great as to overcome the higher vitality of the female sex during those years.

TABLE XXVII.—TOTAL POPULATION, POPULATION LIVING IN CITIES OF AT LEAST 25,000 INHABITANTS, AND POPULATION LIVING IN SMALLER CITIES OR COUNTRY DISTRICTS, CLASSIFIED BY SEX, WITH PER CENT MALE AND FEMALE: 1900.

STATE OR TERRITORY.	POPULATION: 1900.														
	Total.	Male.	Female.	In cities having at least 25,000 inhabitants.			In smaller cities or country districts.			Total.		In cities having at least 25,000 inhabitants.		In smaller cities or country districts.	
				Total.	Male.	Female.	Total.	Male.	Female.	Per cent male.	Per cent female.	Per cent male.	Per cent female.	Per cent male.	Per cent female.

AGE.

By ALLYN A. YOUNG, Ph. D.

SUMMARY OF RESULTS.

The ages of the population were ascertained more accurately at the census of 1900 than at any previous census of the United States. This improvement was largely due to the addition of an inquiry as to date of birth to the former direct question as to age.

The age returns of the more illiterate classes of the population are less accurate than those of the more intelligent classes. Moreover, the distribution of errors in the age returns is such as to suggest that the census information obtained about the more intelligent classes in districts in which there are large numbers of illiterates is less accurate as a rule than information obtained about the same class of persons in districts where the general average of education is higher. The evident explanation is that the census enumerators held more consistently to high standards of accuracy in those regions where a high average of accuracy was possible.

In the concentration of reported ages on round numbers, understatement of age is, except among persons of advanced years, more common than overstatement. The tendency to report ages as less than the truth is strongest in the negro population, stronger in the foreign born white than in the native white population, and is stronger with females than with males. On account of this prevalent understatement of age, the most accurate quinquennial or decennial age groups for use in the presentation of census results are those in which the first year of the group is a multiple of 5, or of 10.

The overstatement of the ages of children, which may be explained as due to the tendency to denote a child's age by the year of life, rather than by the number of completed years, leads to a large apparent deficiency of children in the first few years of life. This apparent deficiency is more marked in the case of children in the second year of life than for those in their first year a result due to the fact that the ages of children less than a year old are reported by months.

The number of centenarians in the population is grossly exaggerated in the returns, this exaggeration being especially marked in the case of the more illiterate classes.

The median age of the aggregate population of continental United States (that is, the age which exactly divides the population into halves) is 22.85 years. One hundred years ago it was 15.97; since 1820 it has increased, on the average, by two-thirds of a year a decade. The median age of the population living in cities of over 25,000 inhabitants is about 3½ years greater than that of the population living in smaller cities and rural districts. The median age is high in the North Atlantic and Western states and low in the South Atlantic and South Central states. In the North Central division it approximates that of the country as a whole. The average age (that is, the quotient resulting from dividing the total years lived by the living population) is some years higher than the median age, being, for the aggregate population in 1900, 26.2 years.

About three-fifths of the population of the United States are between 15 and 60 years old—comprising what is sometimes called the "productive" age group. This is a larger proportion of the population than is found in the same age group in most European countries—a fact which is due to the large number of foreign born adults in our population. But only Holland and the Scandinavian countries have so small a proportion of their population at "productive ages" as is found in the native white population of the United States.

Nearly one-fourth of the population are less than 10 years old and over three-sevenths are less than 20. Less than one-seventh have accomplished half the possible hundred years of human life, and only 23 out of every thousand have passed the allotted "three score years and ten."

The greater average maturity of the urban population, shown by a higher median age, is due to the relatively larger proportion in the period of early middle life. The rural population is relatively more numerous at both extremes of the age table.

Children reported as less than a year old constitute 2.5 per cent of the aggregate population, while children under 5 constitute 12.1 per cent. Both of these proportions are considerably smaller than they were in 1880, and are smaller than the corresponding ratios for most European countries. The proportion of children under 1 in the total population varies from one in 30 in Utah to one in 60 in California. The number of children in the population is relatively least in New England and on the Pacific coast; it is relatively highest in the South and in some of the newer agricultural states of the West and Northwest.

Of the aggregate population 51 per cent are males and 49 per cent are females, but in the age groups of 15 to 19 years, 20 to 24 years, and 80 years and over, there are more women than men. These facts are shown to be in general agreement with the statistics respecting the relative numbers of the sexes born and the death rate of the sexes at various ages. The differences between cities and rural districts, with respect to the proportions of the sexes in the different age groups, are such that they can be only partially explained by the differences between rural and urban death rates; they consequently lead to the conclusion that females predominate among the younger persons migrating from the country to the cities, while males predominate among the migrants who are of middle age.

THE INQUIRY.

The population schedule used by the enumerators at the Twelfth Census contained columns in which were entered, for each person enumerated, the date of birth and the "age at last birthday." The instructions to the enumerators with reference to the mode of entering this information were as follows:

Column 7. Date of birth.—The object of this question is to help in getting the exact age in years of each person enumerated. Many a person who can tell the month and year of his birth will be careless or forgetful in stating the years of his age, and so an error will creep into the census. This danger can not be entirely avoided, but asking the question in two forms will prevent it in many cases.

Enter in the first division of column 7 the name or abbreviation of the month in which the person was born, thus: Jan., Feb., Mar., Apr., May, June, July, Aug., Sept., Oct., Nov., or Dec.

Enter in the second division the year in which the person was born, thus: 1841, 1897, etc.

Column 8. Age at last birthday.—The object of this question is to get the age of each person in completed years, or in the case of a child under one year the age in completed months.

For each person of one year of age or over, enter the age at *last* birthday in whole years, omitting months and days. For children who, on the first day of June, 1900, were less than one year of age, enter the age in months, or twelfths of a year, thus: $\frac{3}{12}$, $\frac{7}{12}$, $\frac{8}{12}$. For a child less than one month old, enter the age as follows: $\frac{0}{12}$.

Endeavor to ascertain in each case the month and year of birth called for in column 7, but where this is impossible get as nearly as possible the exact years of age. An answer given in round numbers, such as "about 30," "about 45," is likely to be wrong. In such cases endeavor to get the exact age.

The inquiry as to date of birth is an innovation in the practice of the United States census. Prior to 1850 the population was returned as within specified age groups. At the censuses of 1850, 1860, 1870, and 1880 the enumerators were instructed to ascertain the age at the last birthday previous to the taking of the census. In 1890 the inquiry was modified to "age at nearest birthday." At the census of 1900 the older form of inquiry was restored—primarily because it accords with popular usage, but also because it gives results comparable with those of the censuses of other countries. In this connection it should be noted that the census age inquiry shows, not how many persons are at a certain age, but how many are in definite age periods—that is, between n and n+1 years old.[1]

The tabulations of the results of this inquiry, printed in Twelfth Census, Volume II, are as follows:

TABLE XVI.—Ages of the aggregate population of the mainland of the United States, classified by sex, general nativity, and color.

TABLE XVII.—Ages of the Chinese, Japanese, and Indian population of the United States, classified by sex.

TABLE 1.—Ages of the aggregate population of the United States, classified by sex, general nativity, and color.

TABLE 2.—Ages of the aggregate population, classified by sex, general nativity, and color, by states and territories.

TABLE 3.—Ages by periods of years of the aggregate population, classified by sex, by states and territories.

TABLE 4.—Ages by periods of years of the native white population of native parentage, classified by sex, by states and territories.

TABLE 5.—Ages by periods of years of the native white population of foreign parentage, classified by sex, by states and territories.

TABLE 6.—Ages by periods of years of the foreign white population, classified by sex, by states and territories.

TABLE 7.—Ages by periods of years of the colored population, classified by sex, by states and territories.

TABLE 8.—Ages by periods of years of the negro population, classified by sex, by states and territories.

TABLE 9.—Ages by periods of years of the aggregate population, classified by sex, general nativity, and color, for cities having 25,000 inhabitants or more.

TABLES 10–18.—Persons of school age, by sex, general nativity, and color, by states and territories.

TABLES 19–21.—Persons of school age, by sex, general nativity, and color, for cities having 25,000 inhabitants or more.

TABLE 22.—Males of militia age, by general nativity and color, by states and territories.

TABLE 23.—Males of militia age, by general nativity and color, for cities having 25,000 inhabitants or more.

[1] With reference to the method of obtaining the ages of the population, European census practice is divided. In the majority of the countries, however, the date of birth is asked, while in the others, "age at last birthday" is the form of the question. In the Italian census of 1880 the two inquiries were combined, as in the United States census of 1900. At the St. Petersburg session (1872) of the International Statistical Congress, the following recommendation was passed: "Whenever the degree of education permits, and especially in large cities, age should be indicated by the year and month of birth. When age is expressed in years, completed years should be understood; for children less than a year old, age should be expressed by the number of completed months." (Compte Rendu, Vol. II, page 425.)

In the state census of Massachusetts, and, since 1885, in that of Rhode Island, the age inquiry has been as to the "nearest birthday."

TABLE 24.—Males of voting age, by general nativity and color, by states and territories.

TABLE 25.—Males of voting age, by general nativity and color, for cities having 25,000 inhabitants or more.

TABLE 26.—Persons of school, militia, and voting ages, by sex, general nativity, and color, by counties.

TABLE 27.—Persons of school, militia, and voting ages, by sex, general nativity, and color, for places having 2,500 inhabitants or more.

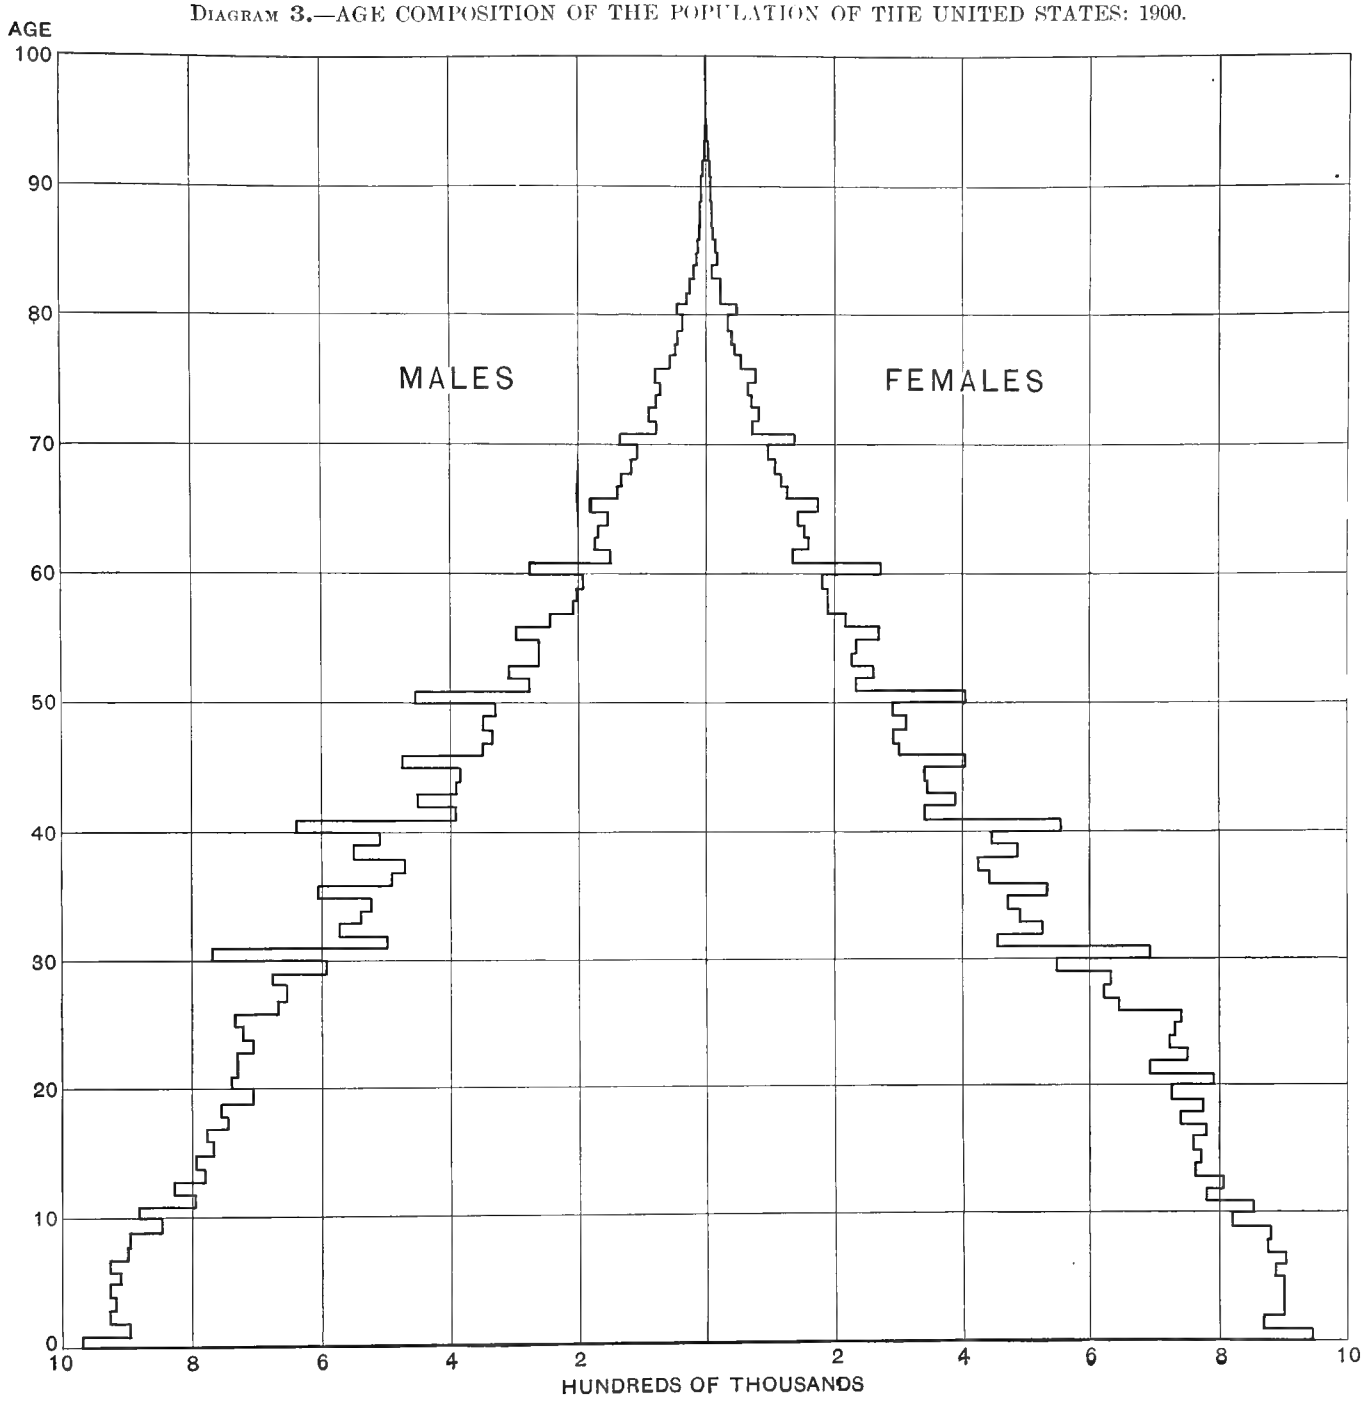
An analysis of the general age tables presented in Volume II, containing a number of summary and ratio tables, is found on pages xxxv to lxxviii of that volume. Volume III, Table 27, pages 683 to 687, shows the numbers of the aggregate population of the United States at each specified age, per 100,000 of known ages, by sex, color, general nativity, and parent nativity. Table 28, pages 689 to 695 of the same volume, shows the numbers of the aggregate, the white, and the colored population in each age group, per 100,000 of known ages, by states and territories.

The age tables contained in the Abstract of the Twelfth Census will be found especially useful for the purpose of supplementing those contained in the present discussion, as they are based on a different system of grouping.

In addition to the tables which relate primarily to age, there are tables which give other classifications of certain age groups. In the tables relating primarily to citizenship and years in the United States, which are to be found in Volume I, pages 907 to 1006, males of voting age are classified by general nativity, parentage, color, and literacy, and foreign born males of voting age by citizenship, country of birth, number of years in the United States, and ability to speak English, for states and territories and for cities having 25,000 inhabitants or more; and males of voting age by general nativity, color, citizenship, and literacy, for counties. A more or less detailed classification by ages has been introduced into the general tables on conjugal condition, school attendance, illiteracy, ability to speak English, and occupations. These tables are printed either in Volume II or in the Special Report on Occupations. In Volume III, pages xlvi and xlvii, there is a table showing, for the registration area and its subdivisions, the white population in each of eight age groups, classified by birthplaces of mothers. In the same volume, pages 285 to 555, is a table which shows the number of children under 1 year of age and under 5 years of age, classified by sex, general nativity, and color, for each state and registration city, and for the groups, counties, and local divisions of registration states.

SIGNIFICANCE OF AGE STATISTICS.

For the purpose of a scientific study of the population the classification by age is only less important and fundamental than that based on sex. Not only does this classification afford information concerning the generation which is at present doing the world's work, but it also makes it possible to form some conclusions about the generation next to enter on its estate. It is scarcely correct, however, to speak of "generations" in the sense in which the word is ordinarily used, because the population is being constantly recruited by births and depleted by deaths.



Professor von Mayr has compared the population of a country to an endless rope made up of a vast number of individual threads.[1] If the rope be cut at any given point, the threads thus exposed to view will vary from those so short that they can scarcely be measured to those of a maximum length. This is the view presented by the census age tables—a view which emphasizes the ever-changing character of the population.

The classification of a population by age makes it possible to measure its economic and military strength. A population containing a large proportion of aged persons and children may be less efficient than a smaller population in which a larger proportion are of productive age. Moreover, the proportion of young children in the population is at least as valuable an index of social conditions as is the birth rate, and is of special utility in the United States, where accurate records of the births are kept in few localities. The chief usefulness of age statistics, however, is found in the increased value which they give to the results of other census inquiries. The combination of the age and sex classifications reveals the number of voters and the number of potential fighting men. It is impossible to compare different classes of the population accurately with reference to such facts as crime, pauperism, literacy, number engaged in productive occupations, mortality rates, etc., without taking into account the differences in their age constitution; for example, the mere fact that death rates are higher in cities than in rural districts is without special significance until the differences in the age constitutions of the two regions are taken into account.

The age composition of a population on a given date may be represented graphically by a diagram sometimes called the age pyramid, but which might more accurately be called the age triangle. The example given on page 133 illustrates in this way the age composition of the population of the United States at the date of the Twelfth Census. The vertical line running through the apex of the triangle is divided into 100 equal parts, one for each year of life. From this line horizontal distances are measured representing, according to the indicated scale, the number of persons reported at the specified age. Distances to the left represent males, to the right females, and the horizontal distance between the sides of the triangle at each point the total population of the specified age. Each complete square within the triangle thus represents 2,000,000 people and the entire area of the triangle represents the total population of the United States of known age, classified by sex and age.

[1] Statistik und Gesellschaftslehre, Vol. II, page 73.

DIAGRAM 3.—AGE COMPOSITION OF THE POPULATION OF THE UNITED STATES: 1900.

The age constitution of the population is affected by three factors—births, deaths, and migration. If a country were so isolated as to be affected neither by immigration nor by emigration, if the number of births in each year were the same as in the year preceding, if the number of deaths were uniform for each successive year and for each year of age, and if the conditions for males and females were identical, the age constitution of the population would be of the simplest and most regular form. If a figure constructed on the same principle as this diagram were drawn to represent such a population, it would take the form of an isosceles triangle. But a condition of this kind is purely imaginary, and is never realized in actual conditions.

First and most fundamental in causing deviations from this theoretical distribution is the fact that neither the number of deaths nor the death rate is constant for all ages. The death rate is very high in the first year of life, decreases rapidly through about the first twelve years, then increases gradually until the period of old age is reached, when it increases with rapid acceleration. If this factor be taken into account—the assumption still being that the population is affected to only a slight extent by migration, and that the number of births in successive years is fairly constant—the graphic representation of the age constitution will be bell-

shaped, the sides of the figure changing from concave to convex in the period of advanced age. These are the conditions represented in the ordinary life table, which, taking as a basis a number of persons beginning life at the same time, shows what would be the number of survivors at each age under prevailing conditions. Such a population would be called a "normal stationary population." The population of France approaches this condition more nearly than that of any other country for which statistics are available.

But in most countries the annual number of births is not a constant factor. If the birth rate is constant, an increasing population tends to perpetuate its increase through the continued augmentation of the number of births; and even with a diminishing birth rate the absolute number of births from an increasing population may be increasing. This condition, which would be shown in the graphic representation by a relatively broader base of the "age pyramid," is prevalent in most European countries, but more noticeably in the United States.

Factors of less importance are the changes in birth and death rates, due to varying economic, social, and climatic conditions. These give to the diagram an irregular form, but their effects on the age constitution are less noticeable in a large and heterogeneous population like that of the United States than in smaller populations.

In addition to these primary factors of birth and death rates, there is one secondary factor, migration, which has an important influence upon the distribution of ages. In the decade 1890 to 1900, 75 per cent of the immigrants to the United States were between the ages of 15 and 40 years, 16 per cent were less than 15, and only 9 per cent were more than 40 years old. In a country where the excess of immigration over emigration is as large as it is in the United States, this preponderance among the immigrants of persons between 15 and 40 years of age leads to a marked widening of the age pyramid at and immediately above these ages. This effect is of course strikingly apparent in the age constitution of our foreign born population.[1] Internal migration has a corresponding effect on the age constitution of particular areas, and thus leads to marked differences between cities and rural districts in the distribution of ages.

[1] Twelfth Census, Vol. II, Plate 2.

ERRORS IN THE REPORTED AGES.

Age may be defined as the sum of time lived since birth. Modern census practice follows ordinary usage in stating the ages of children less than one year old in months and the ages of all other persons in years.

A casual inspection of the tables in which the ages are given by single years will show that while the number reported decreases as the age increases, this decrease is far from constant; indeed, the number reported as of a given age is not always smaller than the number reported at the preceding age.[2] The facts are shown even more clearly in the diagram. It is not probable that in the age constitution of the actual population the principle of continuity is so far violated that the age series could not be represented by a fairly smooth curve; indeed, experience has shown that the greater the accuracy of a census, arising from special care in the enumeration, or from the intelligence of the persons enumerated, the more nearly does the curve representing the age returns approach smoothness of form. Most of the irregularities in the curve representing the ages actually reported take the form of angular deflections, corresponding to abnormal values of single terms. Consideration of the factors which influence the age constitution of the population gives no warrant for supposing that these irregularities correspond to the facts. It is certain, of course, that changes in birth and death rates, as well as variations in the amount and direction of migration, must leave their marks in the form of certain irregularities; but these irregularities would in most cases be spread over a term of several years, and in the curve representing the age series they would take the form of flexures covering a period of several terms in the series. It follows that the irregularities in the age tables represent, for the most part, erroneous information. A knowledge of the nature and amount of the errors is a prerequisite to the intelligent use of census age statistics.

Before entering upon a discussion of the particular forms which these errors take, it will be well to get some idea of the total amount of error. Comparisons with previous censuses, with reference to this point, will make it possible to ascertain the effect of the addition of the inquiry as to date of birth to the inquiry as to age.

[2] Twelfth Census, Vol. II, Table XVI.

If the number returned at each year of age (except, of course, the number reported as "under 1") be subtracted from the number returned at the next lower year of age, the remainders will be the "first differences" of the age series. If these first differences be added, with due regard to plus and minus signs, the sum will, of course, be equal to the difference between the number reported as less than 1 year old and the number classified as "100 and over." But if the signs be disregarded in the addition, the sum of the differences will be equal to the difference between the numbers reported at the first and at the last age, plus twice the sum of the minus differences. It may be assumed that in a series representing the true ages of the population the minus differences are zero, or approximately zero, and the sum of all the differences would therefore be the same whether plus and minus signs were regarded or not. The difference between the sum of the differences in the reported and in the actual ages would be, therefore, approximately twice the sum of the minus differences. It follows that the sum of the minus differences may be properly regarded as a measure of the inaccuracy of the reported ages. It will be noticed that in this method no assumption is made about the true nature of the age series, except that the minus differences are approximately zero. Even if this approximation is not very close, the general validity of the method is not affected. For the foreign born element of the population, however, this method can not be used, as the fact that there are comparatively few foreign born children among the population produces an unduly large number of minus differences. Table I shows these differences computed, as described, for the other classes of the population, at the Twelfth Census and the two censuses immediately preceding; it shows, also, for each of these population classes the total number of persons less than 100 years of age and the per cent which the sum of the minus differences forms of the total number of persons less than 100 years of age.

TABLE I.—SUM OF THE MINUS DIFFERENCES IN THE AGE RETURNS OF THE AGGREGATE POPULATION AND OF THE TOTAL NATIVE, THE NATIVE WHITE BY PARENTAGE, THE TOTAL COLORED, AND THE NEGRO POPULATION, AND PER CENT THAT SUM FORMS OF PERSONS 0 TO 99 YEARS OF AGE, CLASSIFIED BY SEX, FOR CONTINENTAL UNITED STATES: 1900, 1890, AND 1880.

A.—NUMBER OF PERSONS 0 TO 99 YEARS OF AGE.

CLASS OF POPULATION.	1900			1890			1880		
	Both sexes.	Males.	Females.	Both sexes.	Males.	Females.	Both sexes.	Males.	Females.

Negro	10.4	9.6	11.2						

The absolute sums of the differences are in themselves without special significance, on account of the varying sizes of the population classes for which they have been computed. The per cents indicate the relative degrees of inaccuracy in the age returns of the different classes, and may be called the "coefficients of error." Considering first the results for 1900, it appears that the smallest coefficient of error is found in the returns for the native white population of foreign parents, while the largest is found in the returns for the negro population. In the returns for the latter class the coefficient for females is considerably larger than that for males, the excess being reflected in the results for the aggregate population.

A comparison of the results for the three censuses shows that there has been a general gain in accuracy since 1880; for the aggregate population of both sexes the coefficient of error was 8.2 per cent in 1880, 7.5 per cent in 1890, and 3.4 per cent in 1900. The marked diminution in the coefficient of error in 1900 as compared with 1890 indicates that the inquiry as to date of birth had a very important influence on the accuracy of the results. For all classes of the population the returns for 1900 indicate increased accuracy as compared with previous censuses. It will be noted that in 1880 and 1890 the age returns of females were, for all classes of the population, more erroneous than those of males. The addition of the inquiry as to date of birth seems to have had a more marked effect on the age returns of females than on those of males. This is probably due to the fact that a larger proportion of women than of men were seen directly by the enumerators in their house-to-house visitation. The errors in the age returns of males are probably due, in larger measure than those of females, to ignorance of the true age of the person enumerated on the part of those who furnished the information to the enumerator. Naturally this kind of error could not be eliminated by any amount of care in the manner of asking the question. In the case of the native white population of native parents the coefficient of error in 1900 was less for the total population than for either the male or the female population. This seeming paradox is due to the neutralization of a certain amount of understatement of age on the part of one sex by overstatement on the part of the other.

Table II shows the minus differences and per cents in 1900 for the five main geographic divisions.

TABLE II.—SUM OF THE MINUS DIFFERENCES IN REPORTED AGES OF THE POPULATION AND PER CENT THAT SUM FORMS OF PERSONS 0 TO 99 YEARS OF AGE, CLASSIFIED BY PARENT NATIVITY AND RACE, FOR MAIN GEOGRAPHIC DIVISIONS: 1900.

CLASS OF POPULATION.	PERSONS 0 TO 99 YEARS OF AGE: 1900.					SUM OF THE MINUS DIFFERENCES IN REPORTED AGES OF THE POPULATION: 1900.					PER CENT THAT SUM OF MINUS DIFFERENCES FORMS OF PERSONS 0 TO 99 YEARS OF AGE: 1900.

The coefficients of error shown in Table II confirm the inference drawn from Table I, that the reports of the ages of the colored population are especially untrustworthy. In three of the five main geographic divisions the accuracy of the returns for the native white population of native parents is about the same as that of the returns for the native white population of foreign parents. In the South Central division, however, the returns for the native white population of foreign parents are distinctly less accurate than those for the native white population of native parents, while in the Western division this condition is reversed.

The facts shown in Table II with reference to the geographic distribution of errors in the age returns are worthy of note. It will be observed that if the five geographic divisions were ranked in the order of decreasing size of the coefficient of error for the native white population of native and of foreign parents, and for the negro population, the order of rank would be South Atlantic, South Central, North Atlantic, Western, North Central, except that for the native white population of native parents the coefficient of error in the Western division would advance from fourth to second. For each class the greatest amount of inaccuracy is found in the South Atlantic division and the least amount in the North Central division.

A comparison of the coefficients of error shown in Tables I and II with the census statistics of illiteracy shows a general correlation between the two sets of facts.[1] Illiteracy, like the errors in reported ages, is greatest among the negro population and least among the native white population of foreign parents. Moreover, for the total population, illiteracy, like errors in age returns, is at its maximum in the South Atlantic division and at its minimum in the North Central division. But this is as far as the correlation can be carried, for the geographic distribution of illiteracy is by

[1] For the per cent illiterate in the population of the main geographic divisions, see Twelfth Census, Abstract, Table 57.

no means so strikingly uniform for the different population classes as is the geographic distribution of the errors in the age returns. It would seem, therefore, that the presence of a large illiterate population in certain parts of the country has lowered the general accuracy of the returns from those regions. Despairing of getting any but inaccurate returns from a large proportion of the persons in their districts, the enumerators in the more illiterate regions have been less painstaking in their efforts to secure accurate returns from the rest of the population.

By far the most noticeable errors in the age returns are due to the tendency of the persons enumerated to give their ages in round numbers. Multiples of five—especially the even numbers—are the chief centers of concentration. This tendency is not of great importance below the year 20, and the concentration on that year is, in the case of males, offset by an easily explained concentration on the year 21. Table III furnishes a measure of the amount of this concentration on multiples of 5. It is assumed that in the actual population the number of persons aged 25, 30, 35, 40, 45, 50, 55, and 60 years is approximately one-fifth of the total number between 23 and 62 years of age, inclusive—an assumption which corresponds with the facts closely enough to give all necessary accuracy to the method. The per cent that the number reported at multiples of 5 forms of one-fifth of the total number in the age group 23 to 62 indicates the degree of concentration on round numbers.

TABLE III.—MEASURE OF CONCENTRATION ON MULTIPLES OF 5 IN THE REPORTED AGES OF ADULTS IN SPECIFIED CLASSES OF THE POPULATION OF CONTINENTAL UNITED STATES: 1900, 1890, AND 1880.

CLASS OF POPULATION.	TOTAL NUMBER OF PERSONS AGED 25, 30, 35, 40, 45, 50, 55, AND 60 YEARS.			ONE-FIFTH OF TOTAL NUMBER OF PERSONS AGED 23 TO 62 YEARS, INCLUSIVE.			PER CENT THAT NUMBER REPORTED AT MULTIPLES OF 5 FORMS OF ONE-FIFTH OF TOTAL NUMBER AGED 23 TO 62 YEARS, INCLUSIVE.		
	1900	1890	1880	1900	1890	1880	1900	1890	1880
Aggregate	8,136,101	7,079,822	6,026,970	6,792,831	5,390,228	4,161,802	119.8	131.3	144.8
Native white	5,061,174	4,215,705	3,308,893	4,587,382	3,529,587	2,674,693	110.3	119.4	123.7
Foreign white	1,888,584	1,850,037	1,612,472	1,490,345	1,299,775	992,791	126.7	142.3	162.4
Colored	1,186,343	1,014,080	1,105,605	715,104	560,866	494,318	165.9	180.8	223.7

The results presented in Table III show that of the three classes of the population considered the tendency to concentrate on round numbers is strongest in the colored population, while the native white population is least affected by it. For all classes of the population there is a marked improvement in the returns for 1900 as compared with those for 1890, and there was a corresponding improvement in the returns for 1890 as compared with those for 1880. A seeming anomaly lies in the fact that while the returns for 1890 are but little improved in general accuracy over those for 1880, as is evidenced by Table I, yet in the matter of concentration on multiples of 5 the improvement in accuracy over the preceding census was quite as marked in 1890 as in 1900. The explanation is found in the fact that in 1890 a special effort was made to lessen this particular form of error. The instructions to enumerators on this point were full and explicit and evidently were responsible for a very material decrease in the concentration.[1] The further decrease in the amount of this inaccuracy which is shown in the census of 1900 is undoubtedly due to the addition of the inquiry as to date of birth. But it is evident that this particular form of error was not reduced so materially as were other inaccuracies in the age returns. In those European censuses in which the ages are obtained by ascertaining the date of birth, it is found that there is a tendency to concentrate on those calendar years which are multiples of 5.[2] This tendency was undoubtedly operative in the United States in 1900, and on account of the census year being an even multiple of 5 the tendency to concentrate on certain ages and the tendency to concentrate on certain years of birth coincided—that is, so far as all persons born in the first five months of the year are concerned. It seems probable that as high a degree of accuracy would have been obtained if the inquiry as to "age at last birthday" had been omitted.

Unknown ages.—Table IV shows the proportions of the different classes of the population whose ages were returned as unknown.

TABLE IV.—*Number of persons of unknown ages in 100,000 of all ages, classified by sex, for continental United States: 1900 and 1890.*

CLASS OF POPULATION.	1900			1890		
	Both sexes.	Males.	Females.	Both sexes.	Males.	Females.
Aggregate	264	328	197	259	323	192
Native white	212	285	138	210	275	144
Foreign white	244	293	186	270	336	192
Colored	605	641	567	537	593	480

The proportion of persons of unknown age is largest for the colored and smallest for the native white popu-

[2] G. von Mayr, Statistik und Gesellschaftslehre, Vol. II, page 75.

lation—a statement that holds true for each sex and each census. For all classes of the population this proportion is smaller for females than for males. This is undoubtedly due to the fact that a larger proportion of women than of men were seen personally by the enumerators. The excess of the proportion of unknown ages among the colored and the native white population in 1900 over the same proportion for 1890 indicates that the inquiry as to date of birth lessened the number of mere guesses that were accepted by the enumerators as statements of age. For the foreign white population, however, this proportion decreased in 1900 as compared with 1890. This decrease may be due to the fact that on account of the excess of immigration in the decade 1880 to 1890 over the immigration for the ensuing decade, the average foreign born person in 1900 had been in this country longer and was, consequently, better qualified to understand the enumerator's questions and to answer them intelligently.

Age groups.—Combinations of the age classification by single years with the results of other census inquiries are impracticable in most instances. In the majority of cases in which the census differentiates economic and social classes by age, recourse must be had to age groups. From the standpoint of accuracy a classification by groups is preferable to one by single years, and because of the excessive concentration of reported ages on years which are multiples of 5 a quinquennial grouping is especially accurate. This form of group has the added merit of convenience. In the census practice of all countries it is customary to make use of 5-year or of 10-year age groups. The usual form of quinquennial group is the one used in the United States census. In this method the five lowest ages of the table are placed in the first group, the next five ages in the second group, and so on to the end of the table. This form of grouping has been criticised by several statisticians on the ground that each group begins with a multiple of 5; that is, with a year of concentration.[1]

The critics recommend a quinquennial group in which the year of concentration will be in the middle of the group. It is for this reason that the English census defends the use of 10-year groups in which the multiple of 10 comes in the middle of the period,[2] and that the American census has followed the same practice in its mortality statistics.

The accuracy of an age group depends upon the ratio between the number which it includes and the number of persons whose true ages would be included within the same group. In other words, the choice of age groups will depend upon the manner in which concentration takes place. The most accurate form of age group, then, is one which includes with each year of concentration the years from which this concentration is chiefly drawn. If the field of attraction of each age at which concentration occurs does not extend beyond the limits of one age group, the fact of concentration will not affect the accuracy of the groups.

If the tendency to understate ages is materially greater than the tendency to overstate them, the form of group used in the United States census may be more accurate than the one in which the year of concentration is in the middle of the group. The fact that concentration is greater on multiples of 10 than on odd multiples of 5 makes it possible to determine definitely which form of group is the more accurate. The greater the concentration the greater, of course, will be the depletion in the years from which that concentration is drawn. If the quinquennial groups are so formed that the fields of attraction of the years of concentration extend beyond the limits of the several groups, a year which is a multiple of 10 will draw relatively more from the adjacent groups than will a year which is an odd multiple of 5. This will result in making the groups alternately too large and too small. The excess of the number of reported ages in the groups containing years that are multiples of 10 over the number in groups containing years that are odd multiples of 5 may accordingly be used as a measure of the relative inaccuracy of a system of age grouping. Of two series of quinquennial age groupings of the same returns, the one in which the alternate excess and deficiency in the size of the successive groups is less marked will be the more accurate. Table v illustrates the way in which this principle may be applied, and also shows the relations between the successive age groups in a "normal stationary population."

TABLE V.—*Per cent that number in each specified age group forms of the arithmetic mean of the numbers in the two adjacent groups.*

[Farr's English Life Table, No. 3, P_x column.]

AGE GROUP.	Number in group.	Arithmetic mean of numbers in preceding and following groups.	Per cent.
0 to 4 years	4,004,216		
5 to 9 years	3,584,556	3,735,214	96.0
10 to 14 years	3,466,213	3,478,395	99.1
15 to 19 years	3,372,234	3,354,503	100.5
20 to 24 years	3,242,793	3,233,627	100.3
25 to 29 years	3,095,021	3,091,354	100.1
30 to 34 years	2,939,916	2,936,140	100.1
35 to 39 years	2,777,260	2,772,386	100.2
40 to 44 years	2,604,856	2,598,328	100.3
45 to 49 years	2,419,396	2,410,525	100.4
50 to 54 years	2,216,195	2,200,200	100.7
55 to 59 years	1,981,004	1,958,878	101.1
60 to 64 years	1,701,562	1,676,251	101.5
65 to 69 years	1,371,499	1,349,900	101.6
70 to 74 years	998,238	997,009	100.1
75 to 79 years	622,519	654,815	95.1
80 to 84 years	311,393	369,002	84.4
85 to 89 years	116,484	170,194	67.9
90 to 94 years	28,996	59,965	48.4
95 to 99 years	4,445		

It will be noted that during the periods of youth and middle age, when the death rate is fairly constant, the number in each age group is only slightly greater than the arithmetic mean of the numbers in the two adjacent

[1] Bertillon, Cours élémentaire de Statistique, page 52, note; Mayo-Smith, Statistics and Sociology, pages 59 and 60; Holmes, in "The Federal Census," Publications of the American Economic Association, New Series, No. 2, pages 57 and 58.

[2] Census of England and Wales, 1891, General Report, page 27.

groups. It can not be supposed that in the numerical relations of the corresponding age groups of an actual population the regularity would be so great. However, uniform or systematic irregularities in the returns for different classes of the population may be safely charged to errors in the returns, rather than to actual peculiarities in the age constitution of the population.

Table VI shows the results obtained by applying the above process to the age reports of the aggregate population of continental United States. Three methods of grouping have been used; in the first the census plan is followed, a year of concentration being placed at the beginning of each group; in the second the year of concentration is in the middle of the group; and in the third it is placed at the end. For convenience these methods will be called Method I, Method II, and Method III, respectively. The expressions obtained for the relative numerical values of groups containing multiples of 10 and of groups containing odd multiples of 5 are placed in separate columns, and the average of each of these two classes of per cents is shown for each method of grouping. Only those multiples of 5 from 20 to 65 are considered, because on multiples below 20 there is no perceptible concentration, and at advanced ages the rapid decrease of the population has the effect (shown in Table V) of producing a marked diminution in the per cents.

TABLE VI.—*Per cent that the aggregate population in quinquennial age groups containing specified years of concentration forms of the arithmetic mean of the numbers in the two adjacent groups, by three methods of grouping, for continental United States: 1900.*

YEAR OF CONCENTRATION.	Method I.		Method II.		Method III.	
20	104.1	.....	101.1	.....	99.7	.....
25	.....	101.3	.....	104.0	.....	103.5
30	96.7	.....	100.0	.....	104.2	.....
35	.....	101.3	.....	93.0	.....	90.6
40	100.9	.....	110.5	.....	109.7	.....
45	.....	96.1	.....	90.9	.....	92.9
50	103.9	.....	106.6	.....	104.4	.....
55	.....	93.4	.....	93.9	.....	94.2
60	102.0	.....	99.1	.....	103.1	.....
65	.....	97.4	.....	100.4	.....	93.7
Average	101.5	97.9	103.5	96.4	104.2	95.0

The difference between the average value of the per cents for the groups containing even multiples of 5 and for groups containing odd multiples of 5 is, by Method I, 3.6; by Method II, 7.1; by Method III, 9.2. These differences represent the relative inaccuracies of the different methods of grouping, and indicate that Method I is preferable to either of the other two methods. Table VII shows the corresponding differences for various classes of the population, classified by sex.

TABLE VII.—*Excess of the average per cent that the numbers in quinquennial groups containing even multiples of 5 forms of the arithmetic mean of the numbers in the two adjacent groups, over the corresponding per cent for groups containing odd multiples of 5, for the aggregate, native white, foreign white, and negro population, classified by sex, for continental United States: 1900.*

CLASS OF POPULATION.	Method I.	Method II.	Method III.
Aggregate population:			
Both sexes	3.6	7.1	9.2
Males	3.6	6.8	8.2
Females	3.6	7.2	9.4
Native white population:			
Both sexes	2.9	4.3	4.9
Males	3.1	4.4	4.1
Females	2.6	4.2	5.9
Foreign white population:			
Both sexes	3.4	8.3	11.8
Males	3.1	7.7	11.0
Females	3.6	8.8	12.7
Negro population:			
Both sexes	9.9	23.7	32.4
Males	7.5	19.9	17.7
Females	12.5	28.5	37.7

The sizes of the differences shown in Table VII indicate the extent to which preference is given in the age reports to multiples of 10 rather than to odd multiples of 5. This preference is most marked with the negro population, and is more marked with the foreign white than with the native white population. It is more strongly marked for females than for males. But the most important fact brought out by Table VII, as by Table VI, is that Method I, in which the year of concentration is the lowest year in the group, is the most accurate method of grouping; while Method III, in which the year of special concentration is the highest year in the group, is the least accurate. This indicates that the tendency to understate ages is much stronger than the tendency to overstate them. The tendency to understatement of age is strongest in the negro population; stronger in the foreign white than in the native white population; and stronger with females than with males. It is undoubtedly true, although the preceding tables do not show it, that persons of advanced age in the United States, as elsewhere, are liable to overstate their ages. Further discussion of this point will be found in the section on centenarians.

Children's ages.—An examination of the graphic representation of the reported ages does not reveal, for most of the ages below 20, any special form of error, beyond the tendency to prefer even numbers to odd ones, which is noticeable throughout the age table. But it will be seen that there is an apparent deficiency in the number of children in their second year of life—reported in the census tables as "1 year old." Table VIII shows the number of children at each year of age

under 5, and the per cent which that number forms of the total number under 5, for the censuses of 1900, 1890, and 1880.

TABLE VIII.—*Aggregate population at each year of age under 5, and per cent that number at each age forms of the total under 5, for continental United States: 1900, 1890, and 1880.*

AGE.	1900		1890		1880	
	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.
Under 1 year	1,916,892	20.9	1,566,734	20.5	1,447,983	20.9
1 year	1,768,078	19.3	1,077,008	14.1	1,256,956	18.2
2 years	1,830,332	19.9	1,729,817	22.7	1,427,086	20.6
3 years	1,824,312	19.9	1,631,988	21.4	1,381,274	20.0
4 years	1,831,014	20.0	1,629,146	21.3	1,401,217	20.3

At each of the three censuses considered fewer children were returned as 1 year old than at any other age under 5—a deficiency which was most noticeable in 1890 and least noticeable in 1900. It should be remembered, however, that in 1890 the age inquiry related to "age at nearest birthday," and that since the ages of children under 1 were obtained by months, the class tabulated as "1 year old" included, so far as the instructions were strictly followed by the enumerators, only those between 12 and 18 months, inclusive. We should expect that the number of children 1 year old would be noticeably less than the number under 1 year old, on account of the very heavy death rate in the first year of life; but there is no reason to believe that there are fewer children 1 year old than 2 years old. Table IX shows the per cents which the number reported at each of the first three years of life make of the total under 5 in the censuses of certain countries in which—as in the United States—the age question has reference to the last birthday, and the ages of children under 1 are obtained in completed months.

TABLE IX.—*Per cent that population at each specified year of age forms of the total population less than 5 years of age, for countries in which ages are obtained by asking "age at last birthday."* [1]

COUNTRY.	Date of census.	PER CENT OF TOTAL UNDER 5 YEARS.		
		Under 1 year.	1 year.	2 years.

[1] Compiled from the census reports of the countries named.

In only three of the countries included in Table X is the number returned as in the second year of life less than the number reported as in the third year of life. It is legitimate to infer, from the marked difference between these results and those shown in Table IX, that the form of the age question has a very considerable influence on the accuracy of the returns, and that the addition of the inquiry as to date of birth in the United States census must have increased the accuracy of the reported ages of young children. This inference is supported by the fact that the addition of the new inquiry did materially increase the accuracy of the reported ages of adults. There seems to be no reason for supposing that it did not have a corresponding effect on the returns of children's ages. At any rate, the results shown in Table VIII make it clear that the deficiency in the reported number of children 1 year old was less marked in 1900 than in either 1890 or 1880.

Another defect generally found in census age tables is a deficiency in the number of children in the first year of life. In countries in which accurate records of the births and deaths are kept this can be shown by comparison of the census returns and the registration records. In the United States it was first pointed out by Dr. Edward Jarvis,[1] who showed that the number of children reported by the census of 1850 was not enough to account for the number of survivors who were 10 years older at the census of 1860. Gen. Francis A. Walker, Superintendent of the Ninth and

[1] Article on "Immigration," Atlantic Monthly, April, 1872.

Tenth censuses, attributed this deficiency to the fact that parents have a tendency to report children who are in their first year of age as "1 year old."[1] Dr. William Farr had previously reached a similar conclusion with regard to the English census.[2] This explanation is generally accepted as accounting in large measure for the apparent deficiencies in the number of young children. It is evident that the habit of denoting a child's age by the year of life, rather than by the completed year, influences the returns for older children as well as for those under 1. The marked deficiency in the number of children 1 year old must be attributed to this cause. The asking of the ages of children under 1 by months has lessened the overstatement in that year, so that the second class has gained less from the first than it has lost to the third. Additional light is thrown on this question by Table XI, which shows the per cents that the population of different classes under 1, 1, and 2 years old make of the total population less than 5.

TABLE XI.—*Per cent that population at each specified age forms of the total population under 5 years of age belonging to specified classes, for continental United States: 1900, 1890, and 1880.*

CLASS OF POPULATION.	1900			1890			1880		
	Under 1 year.	1 year.	2 years.	Under 1 year.	1 year.	2 years.	Under 1 year.	1 year.	2 years.
Aggregate ...	20.9	19.3	19.9	20.5	14.1	22.7	20.9	18.2	20.6
Native white.....	21.1	19.3	19.9	20.9	14.1	22.7	21.1	18.3	20.6
Colored	20.1	19.1	20.5	19.7	14.7	22.3	29.6	17.7	20.9

In comparing the results shown for the three censuses in Table XI, it should be remembered that the class tabulated as "under 5" in 1890 included only children who were reported to have lived less than 4 years and 6 months, while in 1880 and 1900 the same class included all children who were reported as having lived less than 5 full years. That is, the per cents shown in the table for 1890 have been obtained by the use of a relatively smaller divisor than was used in obtaining the per cents for 1880 and 1900. Hence the fact that the per cent which the population under 1 forms of the population "under 5" is somewhat smaller for 1890 than for 1880 or 1900 indicates that the overstatement of the ages of children really in their first year of life was much more frequent in 1890 than in either of the other censuses. This conclusion is confirmed by an examination of the per cents which the number "1 year old" forms of the number under 5 for 1890. These per cents are too large to represent the true proportion of children between 12 and 18 months, inclusive, to children less than 54 months old. Remembering that the number reported as 1 year old is usually too small rather than too large, it will be seen that some peculiar causes of error were at work in 1890.

[1] Ninth Census, Report on Population, pages xxix and xxx; Report on Vital Statistics, page 516.
[2] Farr, Vital Statistics, page 208.

It may be assumed that many persons disregarded the exact form of the age inquiry in 1890, and that to some extent the age returns of that census as of other censuses represent the completed years. This assumption is corroborated by the fact that the per cents which the population 1 year old form of the total under 5 in 1890 show less difference from the corresponding per cents for 1880 and 1900 in the case of the colored than in the case of the native white population. This indicates that the more illiterate population, or the enumerators working among them, gave less attention to the exact form of the age question. This failure to return all ages at the nearest birthday would partly explain the excessive number returned as "1 year old" in 1890, but it seems probable that there was another cause of error which also operated to swell that number. The instructions to enumerators in that census were to the effect that ages should be returned at the nearest birthday, but that the ages of children under 1 should be reported by single months. It is natural that some of the enumerators should have interpreted these instructions as meaning that only the ages of children less than 6 months old should be reported by single months. This would decrease the number of children reported as in their first year of life, and would correspondingly increase the number reported as 1 year old. It is fair to conclude that the number of children under 1 is stated more accurately by the census of 1900 than by that of 1890. Moreover, there is good reason for believing that in this particular the census of 1900 is more accurate than that of 1880. The addition of the inquiry as to date of birth has increased the general accuracy of the age returns, and has probably lessened the overstatement of the ages of children under 1 as well as of children 1 year old. Evidence of this decreased overstatement is given in Table XI, where the per cent that the population 2 years old forms of the total population under 5 is shown to be smaller in 1900 than in 1880. The returns of the population less than 1 year old by months throw some light on the question of overstatement. These returns were not tabulated at the census of 1880, and in 1890 and 1900 they were tabulated only by three-month periods. Table XII shows the per cent that the population in each of these periods forms of the total under 1, for 1900 and 1890.

TABLE XII.—*Per cent that population at specified months of age forms of the total population less than 1 year of age, for continental United States: 1900 and 1890.*

AGE.	1900			1890		
	Aggregate.	Native white.	Colored.	Aggregate.	Native white.	Colored.
0 to 2 months	25.4	25.1	27.1	22.6	22.4	23.4
3 to 5 months	25.9	25.5	28.4	28.1	27.9	29.4
6 to 8 months	24.8	25.1	23.3	29.2	29.2	29.3
9 to 11 months	23.9	24.3	21.2	20.1	20.5	17.9

It will be noted that in Table XII there is a marked deficiency of children in the last quarter of their first year of life in 1890 as compared with 1900. This fact supports the inference already made, that overstatement was more common in 1890 than in 1900. Children in the third quarter of their first year of life, however, seem to be relatively more numerous in 1890 than in 1900. This is undoubtedly due to the concentration of reported ages on "6 months." In the Massachusetts census of 1895, in which ages were ascertained in the same way as in the Federal census of 1890, but tabulated for each month of the first year, more children were reported as 6 months old than in any other month, the number thus reported amounting to 11.1 per cent of the total population under 1.

For those states in which the registration of births and deaths is fairly complete, it is possible to test the comparative accuracy of the returns of children under 1 year at different censuses. If the registrations of births and deaths were tabulated so as to show not only the total number of births in each month, but also the month of birth and the month of death of children dying before they have lived one year, it would be possible to estimate with reasonable accuracy from such records the number of children less than a year old living at a given date, such as the date for which the census speaks. But the published registration reports, although giving the number of births in each month, classify deaths and ages at time of death only by years. It is necessary, therefore, to assume that five-twelfths of the total number of deaths of children under 1 year in a given calendar year were before and seven-twelfths after June 1. This assumption does not quite accord with the facts, infant mortality being higher in summer than in winter. But the error thus introduced will be small, and for purposes of comparison may be disregarded. The proportion of the number of deaths of children under 1 in the twelve months preceding the taking of the census (estimated in the manner just described) to 1,000 births in the same period may be called the "infantile death rate." Such a rate is, of course, valid only for purposes of comparison. We have as data, then, the number of births during the year preceding the taking of the census, the infantile death rate, and the number of survivors as returned by the census. We can then ascertain by a simple proportion what the approximate number of survivors would have been in a given census if the death rate had been what it was in the year preceding a later census, and if the degree of completeness of the census and the registration statistics had been unchanged. Having thus adjusted the returns of the earlier census to correspond with the death rate at the later census, the next step is to obtain the ratio of this adjusted number of survivors to the number of births during the preceding year. The same proportion of the number of births during the year preceding the taking of the later census will be an approximation to the number of children less than a year old that should have been returned by the later census if the registration records and the census were about as accurate as they were at the earlier census. The difference between this estimated number and the number enumerated will be a very fair measure of the deficiency or excess in the later census as compared with the earlier one. Table XIII shows such a comparison of the census and registration statistics of Rhode Island, Massachusetts, and Connecticut for 1900, 1890, and 1880. The census of 1880 is taken as the standard of comparison. The point to be observed is that if the census and the registration of births were as accurate at one period as another, the "deficiencies" would be approximately zero.

TABLE XIII.—COMPARISON OF THE POPULATION LESS THAN 1 YEAR OF AGE WITH THE REGISTRATION RECORDS OF BIRTHS AND DEATHS FOR MASSACHUSETTS, CONNECTICUT, AND RHODE ISLAND: 1900, 1890, AND 1880.

	MASSACHUSETTS.			CONNECTICUT.			RHODE ISLAND.		
	1900	1890	1880	1900	1890	1880	1900	1890	1880
Births, year ending May 31	71,936	57,813	42,053	20,881	17,367	13,908	10,816	8,399	6,388
Deaths of children under 1 year of age	10,936	9,322	6,411	3,114	2,481	1,927	1,850	1,422	797
Infantile death rate	152	161	152	149	143	139	171	169	125
Survivors, by census	60,492	43,043	37,586	19,774	14,469	12,879	9,368	6,890	6,132
Estimated survivors	64,546	51,120	.....	19,111	16,020	.....	9,834	7,658	5,824
Apparent deficiency	4,054	8,077	.....	−663	1,551	.....	466	768	.....
Per cent of deficiency	6.3	15.8	.....	−3.5	9.7	.....	4.7	10.0	.....

Table XIII shows that if the accuracy of the registration reports was constant, the census returns of children were much less complete in 1890 than in 1880 in each of the states considered. The results for 1900 show smaller relative deficiencies in Rhode Island and Massachusetts, and a gain in Connecticut. This would indicate that the returns of children's ages in Massachusetts and Rhode Island were more complete in 1900 than in 1890, but less complete than in 1880, while in Connecticut they were more complete in 1900 than in either 1880 or 1890. But these results may indicate improvements in the registration of births. In fact, the laws governing the registration of births in Massachusetts were changed at such a time as to affect the comparisons between 1880 and 1890, and the laws in Rhode Island and Connecticut were changed between 1890 and

1900.[1] In these changes we have the explanation of the excess of the apparent deficiency in Massachusetts for 1890 over the deficiencies for the other states in the same census. Here too, undoubtedly, lies the explanation of the apparent deficiencies in Massachusetts and Rhode Island for 1900 as compared with 1880. It is significant that, notwithstanding improvements in the registration returns, the results for Connecticut show that the census of 1900 was relatively more complete in its reports of children under 1 than the census of 1880. In general these results confirm the previous inference that the reports of the ages of young children were much more accurate in 1900 than in 1890 and probably more accurate than in 1880.

It is thought by some that the apparent deficiencies in the number of children returned by the census are in large measure real deficiencies.[2] It is a matter of general census experience that the persons giving the information to the enumerators do not always realize the necessity of including young children in the census, and that a few are accordingly omitted.[3] But such omissions are unimportant as compared with the errors resulting from overstatement of ages. There is no reason for believing that the omissions were relatively more numerous at one census than at another, while it is certain that the manner of obtaining the information as to age had an important influence upon the accuracy of the returns.

Centenarians.—If the returns were accurate there must have been 3,504 persons in the United States in 1900 who had lived more than one hundred years. There is no doubt, however, that this number is an exaggeration,[4] although it is a relatively smaller number than has been returned at any other census of the United States. The number of centenarians in 100,000 population of known ages at the last six censuses has been as follows: 1850, 11; 1860, 10; 1870, 9; 1880, 8; 1890, 6; 1900, 5. This regular diminution indicates, not that the longevity of the population has been decreasing, but that in this as in other particulars the accuracy of the age statistics of the census has been increasing. Table XIV shows the number of centenarians in 100,000 population of all ages, classified by sex, race, and nativity, at the last three censuses.

TABLE XIV.—*Population over 100 years of age in 100,000 of all known ages, by sex, race, and nativity, for continental United States: 1900, 1890, and 1880.*

SEX, RACE, NATIVITY, OR NATIVITY OF PARENTS.	1900	1890	1880
Aggregate:			
Both sexes	4.6	6.4	8.0
Males	3.3	4.4	5.5
Females	6.0	8.5	10.6
Native white:			
Both sexes	0.8	1.4	1.6
Males	0.5	1.0	1.3
Females	1.6	1.9	1.9
Native white—native parents:			
Both sexes	1.0	1.7	.....
Males	0.6	1.2	.....
Females	1.3	2.3	.....
Native white—foreign parents:			
Both sexes	0.3	0.6	.....
Males	0.3	0.5	.....
Females	0.4	0.6	.....
Foreign white:			
Both sexes	3.9	4.4	5.6
Males	3.3	3.6	4.4
Females	4.6	5.3	6.8
Colored:			
Both sexes	29.0	38.6	45.4
Males	21.0	25.6	29.9
Females	38.0	51.6	60.8

The most noticeable fact shown by Table XIV is that the proportion of persons who were reported to be over 100 years old in 1900 is thirty-six times as great for the colored as for the native white population. This difference seems even more remarkable when it is remembered that the death rate of the colored population is considerably higher than that of any other class,[5] and that consequently the real proportion of centenarians is probably less for the colored than for any other class.

The relatively low proportion of centenarians among the native white population of foreign parents is to be explained by the fact that there were very few persons of foreign birth in the United States one hundred years ago.

It will be noted that for every class of the population the proportion of reported centenarians is greater for females than for males. This should not be taken as indicating a greater tendency to the overstatement of age among women of advanced age than among men. In the greater number of age periods the mortality of males is higher than that of females, and consequently more females attain advanced age. For both sexes and for all classes of the population the three censuses show a progressive improvement in the accuracy of the returns of centenarians.

Definite proof of the inaccuracy of the returns of centenarians is given in Table XV, in which the correlation between illiteracy and the proportion of centenarians is shown. The various states are ranked in order of the proportion of reported centenarians in their population, as well as in the order of the per cent of their population 10 years of age and over who can not read or write. If the correlation were perfect, the ranks of the states with respect to these two ratios would, of course, be identical—that is, the differences shown in the last column of the table would be zero. So close a correlation can not be expected, for the number of re-

[1] Massachusetts Registration Report, 1880, appendix, page clxxvi; Connecticut Registration Report, 1900, page 5; Rhode Island Registration Report, 1900, page 136.

[2] Twelfth Census, Vol. III, page xl.

[3] This subject has been treated by the present writer in an article on "The Enumeration of Children," Quarterly Publications of the American Statistical Association, March, 1901, Vol. VII, pages 227 to 254.

[4] In European census practice it is quite common to check the accuracy of the returns of centenarians by special investigation of each case. For a partial list of such investigations see G. von Mayr, Statistik und Gesellschaftslehre, Vol. II, page 74.

"In Prussia the number of persons [in a total population of 30,000,000] declared to be more than 100 years old in 1890 was 149, of whom more than one-half were discovered upon investigation to be of less age; and of these 8.8 per cent were found to be from 95 to 100; 14.3 between 90 and 95; and the rest not yet 90 years old."—Mayo-Smith, Statistics and Sociology, page 61.

Even the uncorrected figures for Prussia amount to a proportion of only one centenarian in every 200,000 of the population—about one-thirteenth of the proportion in the United States in the same year.

[5] For comparative death rates see Twelfth Census, Vol. III, page lxix.

ported centenarians depends upon (1) the number of actual centenarians in the population; (2) the number of persons less than 100 years old, but of advanced age; (3) the proportion of the total number of persons of advanced age who erroneously return themselves as over 100. Only the third factor can be supposed to have any connection with the illiteracy of the population.

TABLE XV.—*Correlation between illiteracy and the number of reported centenarians in 100,000 of known ages, for states and territories: 1900.*

[1] Less than 0.5 in 100,000.

The degree of correlation between the proportion of centenarians and the illiteracy of the population is indicated by the fact that for 24 of the 50 states the differences shown in the last column are less than 6. If there were no correlation between the two ratios the "median difference" would be as liable to be over 14 as to be under 15.

The general age constitution of the state of Iowa is fairly typical of that of continental United States as a whole, and in Iowa the per cent illiterate in the population 10 years old and over is less than in any other state except Nebraska. There were in Iowa, in 1900, 2,226,632 persons of known age, of whom 26 were reported to be more than 100 years old. The corresponding proportion of the population of continental United States would give 884 centenarians, or about one-fourth the reported number. This number, however, can scarcely be regarded as even a maximum estimate; the true number was undoubtedly much less.

AGE CONSTITUTION OF THE POPULATION.

Median and average ages.—The simplest and probably the most significant single expression of the age constitution of the population is the median age. This is the age with reference to which the population can be divided into halves—that is, half of the population are younger and half are older than the median age. In the computation of the median age, it is assumed that the population in the year of life in which the median falls is evenly distributed through that year. The death rate at the ages in which the median falls is so small that the exaggeration of the median age produced by this assumption is very slight. Table XVI shows the median age for different classes of the population at the census of 1900.

TABLE XVI.—*Median age of the population, classified by sex, general nativity, and race, for persons of known age in continental United States: 1900.*

CLASS OF POPULATION.	Both sexes.	Males.	Females.
Aggregate	22.85	23.29	22.43
Native born	20.10	20.20	20.02
Foreign born	38.42	38.71	38.03
Total white	23.36	23.82	22.91
Native white	20.22	20.33	20.12
Native white—native parents	21.10	21.27	20.93
Native white—foreign parents	18.05	17.99	18.11
Foreign white	38.43	38.71	38.04
Total colored	19.70	19.97	19.46
Negro	19.45	19.45	19.44

For the aggregate population of both sexes the median age is 22.85; for males it is 23.29, and for females it is 22.43 years. The difference between the median ages of the two sexes is about 10 months. Part of this difference is due to the larger number of foreign born persons among the males than among the females. Among the different classes of the population the median age is highest for the foreign born population and lowest for the native whites of native parents. The foreign born population increases through immigration, mainly of adults. This explains the high median age of the foreign born, and, coupled with a relatively high birth rate, it explains the low median age of their native children. There is a difference of 1.65 years between the median age of the native white population of native parents and that of the negro population, which indicates the higher birth rate and death rate of the latter class. For each class of the population except the native white of foreign parents the median age is higher for males than for females. It will be noted, however,

that with the exception of the foreign born population and of the native white population of foreign parents the median age falls where it would be affected by the tendency of males to overstate their ages for the purpose of being counted as of voting age. If there is any bias in the errors in the age returns of females at corresponding ages, it takes the form of understatement. In view of these considerations it seems unsafe to attach any special significance to the difference between the median ages of males and females.

Table XVII shows the median age of the population, classified as living in urban and in rural districts in 1900.

TABLE XVII.—*Median age of the population, classified by sex and as living in cities having at least 25,000 inhabitants, in cities having at least 100,000 inhabitants, and in smaller cities or country districts, for continental United States: 1900.*

	Both sexes.	Males.	Females.
Continental United States	22.85	23.29	22.43
Cities having at least 25,000 inhabitants	25.40	25.83	25.01
Smaller cities or country districts	21.85	22.34	21.33
Cities having at least 100,000 inhabitants	25.36	25.79	24.97
Smaller cities or country districts	22.22	22.68	21.75

The median age of the population living in cities of over 25,000 inhabitants is about three and one-half years greater than that of the population living in smaller cities or country districts. This difference may be attributed to two main causes—the higher birth rate of the rural districts, and the migration from the country to the cities, which, like migration from abroad, consists largely of adults. Moreover, the cities contain a larger proportion of foreign born persons than do the rural districts. The median age of the population in cities having between 25,000 and 100,000 inhabitants is somewhat higher than it is in larger cities. The difference between the median ages of the population in urban and in rural districts is slightly larger for women than for men.

Table XVIII shows the median age of the population, classified by sex, for every census the United States has taken. Before 1880 the ages of the population were not given by single years. In 1790 the ages of only the free white male population were obtained, and in only two groups—under 16 and over 16. In successive censuses new details were added to the age classification, and since 1830 the ages of that part of the population in which the median age falls have been tabulated in quinquennial groups. For the censuses before 1880 it has been assumed for the purpose of computing the median age that the proportions of the population at the single years within the groups were as in 1900. For the colored population the returns of the negro population in 1900 have been used as a standard, for no other classes were counted as "colored" before 1870.

TABLE XVIII.—*Median age of the population, classified by sex and race, for continental United States: 1790 to 1900.*

CENSUS.	AGGREGATE.			WHITE.			COLORED.

1800	.....	.....	.....	15.97	15.73	16.27	.....	.....	.....
1790	.....	.....	.....	.....	15.88	.....	.....	.....	.....

The most significant fact shown by the results in Table XVIII is the general increase in the median age of the population. This is probably due to a combination of factors, among which are a decreasing birth rate, a decreasing death rate, and an increase in the number of the foreign born. The median age of the aggregate population of both sexes has increased during every decade since 1820. The total amount of this increase in the eight decades is 6.2 years, or an average of about two-thirds of a year per decade. The greatest apparent increase has been between 1890 and 1900, but this is probably due in part to the fact that in 1890 many persons gave their ages as at their last birthday, notwithstanding the fact that the question in that census called for "age at nearest birthday." This error undoubtedly makes the median age for that census somewhat too low. The median age of the white population increased during each decade from 1810 to 1900, the increase amounting in the ninety years to 7.4 years, or an average increase of about five-sixths of a year in a decade. For both the white and the colored population the increase in the median age has been greater for males than for females. So far as the white population is concerned this may be partly due to the large excess of males in the increasing foreign born population.

Table XIX shows the median age and quartiles for states and territories at the census of 1900. The quartiles might be called "secondary medians." One-fourth of the population are below and three-fourths are above the first quartile; three-fourths are below and one-fourth are above the second quartile.

TABLE XIX.—MEDIAN AGE AND QUARTILES OF THE TOTAL POPULATION: 1900.

STATE OR TERRITORY.	Median age.	First quartile.	Second quartile.
Continental United States	22.85	10.52	38.75

Idaho	22.45	9.54	37.59
Wyoming	24.89	11.53	36.91
Colorado	25.92	11.89	39.49
New Mexico	21.12	8.86	37.27
Basin and Plateau	21.33	9.39	37.12
Arizona	24.24	10.60	38.32
Utah	19.07	8.49	35.19
Nevada	28.30	14.56	44.91
Pacific	27.12	13.23	41.59
Washington	25.80	11.81	39.55
Oregon	25.33	12.19	40.70
California	28.04	14.14	42.81

The median age is highest in the New England and the Pacific states, and lowest in the Southern South Atlantic and the Western South Central divisions. The maximum, 28.50 years, is in New Hampshire; the minimum, 18.04 years, is in South Carolina. The region in which the median age is higher than that of continental United States as a whole includes all of the New England and North Atlantic states, the South Atlantic states north of the Potomac river, all the states of the Eastern North Central division except Wisconsin and Iowa, and all the states of the Western division except New Mexico, Utah, and Idaho. Map 20 shows the geographic distribution of median ages, classified in three arbitrarily selected groups.

The distribution of the quartiles necessarily has a very close correlation with that of the median. The position of the lower quartile, however, is influenced especially by the proportion of children in the population, while the position of the upper quartile is more responsive to variations in the proportions of persons of advanced years in the population. It is significant, therefore, that the maxima for the lower quartile are in California and Nevada, while the maxima for the upper quartile are in Maine, Vermont, and New Hampshire. For both quartiles the minima are in South Carolina and Indian Territory.

Table XX shows the average age of certain classes of the population in 1900, 1890, and 1880. The average age is obtained by ascertaining the sum of the ages of the population and dividing this sum by the number of the population. For this purpose it is assumed that the population is distributed evenly through each year of life; thus, the population reported as 47 years old is assumed to average 47½ years. As the age tables do not show the ages of centenarians by single years, it has been assumed that their average age is that which the Massachusetts census of 1895 reports for that state—102⅛ years.

MAP 20.—MEDIAN AGE OF THE TOTAL POPULATION, FOR STATES AND TERRITORIES: 1900.

Average age	26.2	25.1	24.6	24.2	23.1	22.6	40.3	37.8	38.8	23.5	22.2	21.9

The average age, like the median, has risen during the period from 1880 to 1900, the total increase for the aggregate population amounting to 1.6 years, while the increase in the median age in the same period was about 2 years. The increase in the average age of both the native white and the colored population, also, was 1.6 years, while the increase in the average age of the foreign white population was but one-tenth of a year less. During the period 1880 to 1890, in which an unprecedentedly large number of immigrants came to the United States, the average age of the foreign born population declined. During the decade 1890 to 1900 the immigration was less, so that at the end of the decade there was a relatively large number of foreign born persons who had been in the United States more than 10 years. This caused an increase of a year and a half in the average age of the foreign white population during that decade. The average age, like the median, is highest for the foreign white and lowest for the colored. In computing both the average and the median age it has been assumed that in 1890 the age question was answered as asked, that is, that the age reports represent the ages of the population at the nearest birthdays. If it be thought that for most of the returns the age was really age at last birthday, corresponding changes should be made in the average and median ages. On this supposition the median age for that census would be raised by 6 months. The average age would be, for the aggregate population, 25.6 years; for the native white, 23.6 years; for the foreign white, 38.3 years; for the colored, 22.7 years.

Productive and nonproductive ages.—An age classification which is frequently used is that into productive and nonproductive ages. It has been said that from the economic point of view this is the most important of the statistical groupings of the population.[1] The idea is that the population can be grouped by ages in such a way as to differentiate those who have to bear the brunt of the economic struggle and those who are economically dependent. The division usually adopted is into three groups, persons under 15 and persons over 60 years of age being classed as economically unproductive. Of course the limits of these groups are arbitrarily chosen and it is quite certain that they are not very accurate. The census of 1900 showed that the per cent of males who were engaged in gainful occupations was as follows: 10 to 14 years of age, 21.4; 15 to 64 years of age, 90.8; 65 years and over, 68.4. For females the per cents were as follows: 10 to 14, 8.1; 15 to 64, 21.4; 65 and over, 9.1. The upper limit of the group of "productive ages" ought to be higher than either 60 or 65 years. Care should be taken, therefore, not to place too much emphasis on the economic significance of the classification into "productive" and "nonproductive" ages. Yet this classification is not without utility. It is desirable for many purposes to have a classification of the ages of the population less detailed than the usual grouping in 5-year or 10-year periods, and for such purposes this one serves as well as any other. The year 15 marks off with a rough accuracy the years of childhood from those of adult life. The year 60 marks quite as accurately the completion of the period of "middle age" and the beginning of "advanced years." Tables XXI and XXII show the population in these three age groups classified by sex, race, and nativity for the censuses of 1900, 1890, and 1880.

Females	39.7	55.6	4.7	42.0	53.5	4.5	44.1	51.5	4.4

The age group containing the years 15 to 59, which may be called "productive ages," contained in 1900 a larger proportion than in either 1880 or 1890. For every class of the population this group was relatively larger in 1900 than in 1890, and for the native white and colored populations it was relatively larger in 1900 than in 1880.

The decline in the proportion of the foreign white population at productive ages in the decade 1880 to 1890 was undoubtedly due to the large foreign immigration of that decade. The decline of immigration in the decade 1890 to 1900 brought with it a slight increase in the proportion of foreigners of productive age and a marked increase in the same class over 60 years of age. For the aggregate population a slightly larger proportion of men than of women were of productive age at each of the three censuses. For the native white and colored population, however, the proportion of the female population who were of productive age was larger than the corresponding proportions for males in 1890 and 1880, but the differences between these proportions are too small to be of significance.

The approximate equality between the per cents of the native white and the colored population who are of productive age is noticeable. It should be remembered, however, that the native white include the native children of foreign parents, so that this close approximation is more interesting than significant. The very marked excess of the percentage in productive ages among the foreign born over the corresponding per cents for the other classes of the population is self-explanatory.

The general increase in the proportion of the population at productive ages has been accompanied by an increase in the proportion 60 years of age and over. For the native white and negro populations these facts seem to indicate a decreasing birth rate and possibly an increase in the average length of life.

For every class of the population the proportion under 15 was less in 1900 than in either 1890 or 1880. Table XXIII shows a similar grouping of the population by age for the most important European countries.

TABLE XXIII.—POPULATION OF EUROPEAN COUNTRIES IN SPECIFIED AGE GROUPS AND PER CENT THAT POPULATION IN EACH GROUP FORMS OF THE TOTAL POPULATION OF KNOWN AGES.[1]

COUNTRY.	Date of census.	All known ages.	Under 15 years.	15 to 59 years.	60 years and over.	PER CENT.		
						Under 15 years.	15 to 59 years.	60 years and over.
Austria	1890	23,895,413	8,160,450	13,850,593	1,884,370	34.1	58.0	7.9
Belgium	1890	6,069,321	1,989,448	3,491,864	588,008	32.8	57.5	9.7
Denmark	1890	2,170,752	755,702	1,193,288	221,762	34.8	55.0	10.2
England and Wales	1891	29,002,525	10,172,235	16,684,809	2,145,481	35.1	57.5	7.4
France	1890	38,112,731	10,000,152	23,343,426	4,769,153	26.2	61.3	12.5
Germany	1890	49,428,470	17,372,100	28,111,728	3,944,642	35.1	56.9	8.0
Holland	1890	4,511,169	1,647,231	2,448,266	415,672	36.5	54.3	9.2
Hungary	1890	17,339,226	6,401,888	9,746,809	1,190,529	36.9	56.2	6.9
Ireland	1891	4,702,964	1,529,067	2,681,784	492,113	32.5	57.0	10.5
Italy	1880	28,455,948	9,158,457	16,750,238	2,547,253	32.2	58.9	8.9
Norway	1890	1,986,955	712,310	1,051,201	223,444	35.9	52.9	11.2
Portugal	1890	5,030,564	1,669,139	2,857,460	503,965	33.2	56.8	10.0
Scotland	1891	4,025,647	1,432,225	2,276,776	316,646	35.6	56.5	7.9
Spain	1890	17,252,472	5,741,024	10,219,423	1,292,025	33.3	59.2	7.5
Sweden	1890	4,784,981	1,593,316	2,643,034	548,631	33.3	55.2	11.5
Switzerland	1890	2,933,334	941,269	1,716,082	275,983	32.1	58.5	9.4

[1] Computed from the tables given by Bertillon, in Statistique Internationale résultant des Recensements de la Population exécutés dans les divers Pays de l'Europe pendant le XIXe siecle et les époques précédentes. [Paris, 1899.]

When these results are compared with those for the aggregate population in 1900, it appears that the United States has an unusually large proportion of its population in the group of productive ages. Only France and Spain—countries in which the population is more nearly stationary than in any other countries of Europe—have a larger per cent of their population in productive ages than has the United States. It will be noted that the censuses of the European countries included in Table XXIII, except that of Italy, were taken in, or near, 1890. Comparing with these results the returns for the United States in 1890, it appears that not only in France and Spain, but also in Switzerland and Italy, the population of productive age was a larger proportion of the total population of known ages than in the United States. The main cause of the relatively high proportion of productive ages in the United States is the importance of the foreign born element in our population. For most European countries emigration exceeds immigration. The native white population and the colored population (96 per cent of whom are native) of the United States in 1900 included relatively fewer persons who were of productive age than did any of the countries shown in Table XXIII, except Holland, Denmark, Norway, and Sweden. Making the comparison with the United States census of 1890, only Holland and Norway had a smaller proportion at productive ages than our native white, and only Norway a smaller proportion than our colored population. It is significant that all of the European countries shown in the table had in 1890 a larger per cent of population more than 60 years old than had the United States in either 1900 or 1890.

Table XXIV shows the population at productive and nonproductive ages in cities and rural districts, for 1900. The age returns for cities have not been tabulated in such a way as to make it possible to use the same upper limit for the period of productive ages as in the other tables. Accordingly, those over 15 and less than 65 years of age have been considered as of productive age.

The table shows that the per cent of the population in the productive age group is larger in the cities than in the rural districts, this difference being more marked for females than for males. It should be noted, however, that the proportion who are of productive ages does not increase with the size of the city; on the contrary the per cent for cities of between 25,000 and 100,000 population is larger than for cities of over 100,000 population. Persons over 65 years of age, also, are relatively more numerous in the smaller cities. Children under 15, however, are found in relatively greater numbers in the large cities than in cities of less than 100,000 population. The difference between the age constitutions of the urban and rural districts, so far as the relative numbers in productive and nonproductive ages is concerned, is to be explained largely by the migration from the rural districts to the cities, although differences in birth and death rates and in the number of foreign born residents, also, must be taken into account.

TABLE XXIV.—*Number and per cent of the total population of known ages in specified age groups, classified by sex and as living in cities having at least 100,000 inhabitants, in cities having between 25,000 and 100,000 inhabitants, and in smaller cities or country districts, for continental United States: 1900.*

SEX OR AGE GROUP.	IN CITIES HAVING AT LEAST 100,000 INHABITANTS.		IN CITIES HAVING BETWEEN 25,000 AND 100,000 INHABITANTS.		IN SMALLER CITIES OR COUNTRY DISTRICTS.	
	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.

Washington	511,814	157,899	328,857	25,088	30.8	64.3	4.9
Oregon	412,604	126,135	259,815	26,654	30.6	63.0	6.4
California	1,474,879	389,831	959,314	125,734	26.4	65.1	8.5

Considering first the results for the main geographic divisions, it appears that the maximum per cent of productive ages is found in the Western division, with the North Atlantic, North Central, South Atlantic, and South Central divisions following, in the order named. The per cents for the minor geographic divisions do not show any marked deviation from this general order. The maximum per cent of 64.5 is found in the Pacific division and the minimum of 53.4 in the Southern South Atlantic division.

The study of the results for single states will be facilitated by Table XXVI, which shows the states in order of the proportion of their population who are of productive age.

TABLE XXVI.—STATES AND TERRITORIES IN ORDER OF THE PER CENT OF THEIR TOTAL POPULATION OF KNOWN AGES WHO ARE FROM 15 TO 59 YEARS OF AGE: 1900.

RANK.	State or territory.	Per cent.	RANK.	State or territory.	Per cent.
1	District of Columbia	67.84	26	Idaho	58.72
2	Montana	66.93	27	Iowa	58.65
3	Wyoming	66.43	28	Kansas	58.39
4	Nevada	65.08	29	Nebraska	58.19
5	California	65.04	30	Minnesota	57.67
6	Colorado	64.99	31	North Dakota	56.89
7	Massachusetts	64.55	32	Wisconsin	56.84
8	Rhode Island	64.40	33	Florida	56.81
9	Washington	64.25	34	Kentucky	56.52
10	New York	63.38	35	South Dakota	56.26
11	Connecticut	63.37	36	West Virginia	56.18
12	Oregon	62.97	37	Oklahoma	55.89
13	New Hampshire	62.49	38	New Mexico	55.83
14	New Jersey	62.43	39	Tennessee	55.79
15	Arizona	61.88	40	Virginia	55.36
16	Ohio	61.31	41	Louisiana	54.59
17	Delaware	61.19	42	Arkansas	54.33
18	Pennsylvania	60.94	43	Texas	54.15
19	Maine	60.86	44	Indian Territory	54.08
20	Illinois	60.73	45	Alabama	53.92
21	Vermont	60.48	46	Georgia	53.57
22	Indiana	60.30	47	Utah	53.36
23	Michigan	60.27	48	Mississippi	53.19
24	Maryland	59.96	49	North Carolina	53.12
25	Missouri	59.16	50	South Carolina	52.30

The states in which the proportion of the population of productive ages is greater than that for continental United States as a whole (59.10) include all of the states in the North Atlantic division, together with Delaware, Maryland, and the District of Columbia in the South Atlantic division; Ohio, Michigan, Indiana, Illinois, and Missouri in the North Central division; and all of the Western division except Idaho, Utah, and New Mexico. There is a very close agreement between this area and the area in which the median age is higher than it is for continental United States as a whole.

The distribution of the population in 10-year age groups.—For most purposes served by the study of the age constitution of the population a classification in 10-year periods is sufficiently detailed. Tables XXVII to XXXII show such a grouping of the population, classified by sex, race, and nativity, for the censuses of 1900, 1890, and 1880. The number at advanced ages is so small that all those over 80 years of age have been included in one group.[1]

[1] It will be noted that each of these groups begins with a year which is a multiple of 10. For some purposes it will be found convenient to use a system of grouping in which the lowest age in each group is an odd multiple of 5. Such a distribution of the population for 1900 can be found in the Abstract of the Twelfth Census, pages 11 to 13.

TABLE XXVII.—POPULATION IN SPECIFIED AGE GROUPS, CLASSIFIED BY SEX, RACE, AND NATIVITY, FOR CONTINENTAL UNITED STATES: 1900.

SEX, RACE, NATIVITY, OR NATIVITY OF PARENTS.	Under 10 years.	10 to 19 years.	20 to 29 years.	30 to 39 years.	40 to 49 years.	50 to 59 years.	60 to 69 years.	70 to 79 years.	80 years and over.

Considering first the results for 1900, it will be seen that for each class of the population, except the foreign white, the number of persons less than 10 years old is greater than in any other decennial period. For the foreign white population the maximum number is in the group 30 to 39 years. The diminution in the numbers of the aggregate population in successive age groups has a certain regularity, as is shown in Table XXXIII.

TABLE XXXIII.—*Excess of population in each specified age group over population in next higher group, for continental United States: 1900.*

AGE GROUP.	Number in group.	Excess over number in next higher group.	Per cent.
0 to 9 years	18,044,751	2,408,428	13.4
10 to 19 years	15,636,323	1,771,866	11.3
20 to 29 years	13,864,457	3,343,637	24.2
30 to 39 years	10,529,820	2,819,042	26.8
40 to 49 years	7,701,778	2,547,777	33.1
50 to 59 years	5,154,001	2,059,712	39.8
60 to 69 years	3,094,289	1,690,591	54.8
70 to 79 years	1,403,698	.....	.....

The per cent which the difference between the numbers in the first and second groups form of the number in the first group is somewhat larger than the corresponding per cent for the second group, but for all the other groups the rate of diminution increases as the age increases.

Some interesting results are yielded by a comparison of the distributions of the total population of various classes to the several age groups. The figures will be found in Table XXVIII. A larger per cent of the total native white population of foreign parents than of any other class of the population is in the groups 0 to 9 years and 10 to 19 years. This is explained, of course, by the fact that the adult foreign white population has been increasing faster than the adult native population. A larger per cent of the foreign white population than of any other class is found in each of the groups above 19 years. Larger proportions of the negro population than of the native white population of native parents are less than 10 years old and between 10 and 20 years old. In the groups composed of the years of age from 20 to 79 there are relatively more native whites of native parents than negroes. The same proportion of each of these two classes of the population claims to have reached fourscore.

Nearly one-fourth of the aggregate population are less than 10 years old and over three-sevenths are less than 20. Less than one-seventh have accomplished half the possible hundred years of human life, and only 23 out of every 1,000 have passed the allotted "three-score years and ten." It is scarcely necessary to point out that these results have no bearing on the question of the average length of human life. In an increasing population, like that of the United States, the lower age groups are normally better filled than in a stationary or decreasing population.

Over one-fourth of the negro population, as well as of the native white population of native parents, are less than 10 years old. Nearly one-half of the latter and more than one-half of the former are less than 20 years old. Among the native white population of native parents 133 in 1,000 have passed their fiftieth year, and 24 in 1,000 have passed their seventieth year. About one-tenth of the negro population are more than 50 years old, and only 18 in 1,000 are more than 70 years old. Three-tenths of the native white population of foreign parents are less than 10 years old, but only 1 in 53 of the foreign white population is in the same age period. Considerably over one-half of the native white population of foreign parents and one-tenth of the foreign white population are less than 20 years old. Among the native white population of foreign parents only 1 in 22 has passed the fiftieth year, and only 5 in 1,000 have passed the seventieth year. About three-tenths of the foreign white population are at least 50 years old, and 53 in 1,000 are at least 70 years old.

For the aggregate population there are relatively more females than males in each of the groups below 30 years, and in the group 70 to 79 years. Males are relatively more numerous in the three groups comprising the years of life from 30 to 59. In the groups 60 to 69 years and 80 years and over, the relative numbers of the two sexes are approximately equal. In the native white population of native parents, as well as in the foreign white population, females are relatively more numerous in each of the groups below 30 and above 59 years. In the period of middle life there are for each of these two classes relatively more males than females. In the native white population of foreign parents the proportions of males less than 10 years old and between 40 and 60 years old are larger than the proportions of females. There are relatively more females than males in the groups of 10 to 19 and 20 to 29 years, while the proportions of the two sexes in the groups 30 to 39, 60 to 69, 70 to 79 years, and 80 years and over are approximately equal. The excess of the relative numbers of one sex or the other is distributed for the negro population in the same way as for the native white population of foreign parents, except that among the negro population there is a larger per cent of males than of females in the group 60 to 69 years, and a larger per cent of females than of males in the group 80 years and over.

A comparison of the returns for 1900 with those for 1880 shows that for the aggregate population of both sexes there has been an increase in the proportion in each age group above 29 years, and a decrease in the proportion in each of the two groups below 20 years, while the proportion in the group 20 to 29 years has remained about constant. The same results appear when the per cents for the two sexes are considered separately, except that for males there has been a decrease in the proportion in the group 20 to 29 years, which is exactly balanced by a corresponding gain for females. This gain in the proportion of the population who are in

the more advanced age groups has been fairly constant during the two decades, for the same general results are gleaned from a comparison of the per cents for 1890 and 1900, although, of course, the differences are not so marked. It is to be noted that while those tabulated as "under 10" in 1890 included only those who reported their ages as being less than 9½ years, this group contained a proportion of the population larger than the proportion of those who reported themselves as less than 10 in 1900.

Comparison of the returns of the foreign white population in 1900, 1890, and 1880 shows that throughout the two decades there has been an increase in the per cent of that class of the population who are in the groups above 49 years. In the other age groups there has been a relative decrease during the two decades, except that the proportion of the population between 20 and 29 years of age was greater in 1900 than in 1880, and the proportion between 30 and 39 years of age was markedly greater in 1900 than in 1890. Between 1880 and 1900 the age constitution of the native white population so changed as to leave a larger or equal proportion in each of the groups above 29 years and a smaller proportion in the other groups, this decrease being most marked for children under 10 years of age. The per cents for the colored population show a marked decrease between 1880 and 1900 in the proportion in the first ten years of life, which is balanced by a slight increase for each of the other groups.

Tables XXXIV and XXXV show the population of cities and of the rest of the country, classified by 10-year age periods. The age returns of cities were not tabulated in such a way as to make it possible to use the form of grouping that has been used in the preceding tables.

TABLE XXXIV.—POPULATION IN SPECIFIED AGE GROUPS, CLASSIFIED BY SEX AND AS LIVING IN CITIES HAVING AT LEAST 100,000 INHABITANTS, IN CITIES HAVING BETWEEN 25,000 AND 100,000 INHABITANTS, AND IN SMALLER CITIES OR COUNTRY DISTRICTS, FOR CONTINENTAL UNITED STATES: 1900.

	Under 5 years.	5 to 14 years.	15 to 24 years.	25 to 34 years.	35 to 44 years.	45 to 54 years.	55 to 64 years.	65 years and over.
In cities having at least 100,000 inhabitants:								
Both sexes	1,505,471	2,727,992	2,730,811	2,766,216	2,058,737	1,230,616	697,944	452,598
Males	757,408	1,359,429	1,279,389	1,390,246	1,082,452	629,101	341,563	203,291
Females	748,063	1,368,563	1,451,422	1,375,970	976,285	601,515	356,381	249,307
In cities having between 25,000 and 100,000 inhabitants:								
Both sexes	549,319	1,034,232	1,095,020	1,050,331	781,601	493,577	286,447	196,260
Males	276,428	512,768	515,896	530,862	408,881	253,349	139,500	88,729
Females	272,891	521,464	579,124	519,469	372,720	240,228	146,947	107,531
In smaller cities or country districts:								
Both sexes	7,115,838	13,192,133	11,065,274	8,268,933	6,371,609	4,673,248	3,018,144	2,431,640
Males	3,599,776	6,690,240	5,579,746	4,303,756	3,381,448	2,520,008	1,581,361	1,263,398
Females	3,516,062	6,501,893	5,485,528	3,965,177	2,990,161	2,153,240	1,436,783	1,168,242

TABLE XXXV.—*Per cent that population in specified age groups forms of the total population of known ages, classified by sex and as living in cities having at least 100,000 inhabitants, in cities having between 25,000 and 100,000 inhabitants, and in smaller cities or country districts, for continental United States: 1900.*

	Under 5 years.	5 to 14 years.	15 to 24 years.	25 to 34 years.	35 to 44 years.	45 to 54 years.	55 to 64 years.	65 years and over.
In cities having at least 100,000 inhabitants:								
Both sexes	10.6	19.2	19.3	19.6	14.5	8.7	4.9	3.2
Males	10.8	19.3	18.1	19.7	15.4	8.9	4.9	2.9
Females	10.5	19.2	20.4	19.3	13.7	8.4	5.0	3.5
In cities having between 25,000 and 100,000 inhabitants:								
Both sexes	10.0	18.8	20.0	19.1	14.3	9.0	5.2	3.6
Males	10.1	18.8	18.9	19.5	15.0	9.3	5.1	3.3
Females	9.9	18.9	21.0	18.8	13.5	8.7	5.3	3.9
In smaller cities or country districts:								
Both sexes	12.7	23.5	19.7	14.7	11.4	8.3	5.4	4.3
Males	12.4	23.1	19.3	14.9	11.7	8.7	5.5	4.4
Females	12.9	23.9	20.1	14.6	11.0	7.9	5.3	4.3

The groups under 15 years, and each of the two groups in which persons more than 55 years old are distributed, contain a smaller proportion of the urban population than of the population living in "smaller cities or country districts." Moreover, the group 15 to 24 years contains a larger proportion of the latter class than it does of the population living in cities having at least 100,000 inhabitants. All of the other groups are relatively larger in the cities of over 25,000 inhabitants than in the rest of the country, this excess being most marked for the group 25 to 34 years. It appears that the greater average maturity of the urban population, shown by its higher median age, is due to the relative deficiency of children and the relatively larger population in the period of early middle life.

A slightly larger proportion of the population is in the groups 15 to 24, 45 to 54, 55 to 64, and 65 years and over in cities of 25,000 to 100,000 inhabitants than in larger cities.

The difference between the per cents of the population in the group 5 to 14 years in the cities and in the rural districts is somewhat more marked for females than for males, but in the group 15 to 24 years the proportion of the male population is smaller and of the female population larger in cities than in rural districts. This may indicate that the migration of females from the country to the city takes place, on the average, at an earlier age than that of males.

Tables XXXVI and XXXVII show the distribution of the population of the states and territories and the geographic divisions in 10-year age periods.

TABLE XXXVI.—TOTAL POPULATION IN 10-YEAR AGE PERIODS: 1900.

STATE OR TERRITORY.	All known ages.	Under 10 years.	10 to 19 years.	20 to 29 years.	30 to 39 years.	40 to 49 years.	50 to 59 years.	60 to 69 years.	70 to 79 years.	80 years and over.

Utah	29.0	22.8	16.3	12.4	8.6	5.3	3.4	1.7	0.5
Nevada	17.6	16.4	18.8	15.6	12.7	9.6	6.4	2.3	0.6
Pacific	19.1	17.9	18.2	17.1	12.5	7.8	5.0	2.0	0.4
Washington	21.4	18.1	18.1	18.3	12.5	6.8	3.4	1.2	0.2
Oregon	20.5	19.7	17.6	15.9	12.2	7.6	4.3	1.8	0.4
California	17.8	17.3	18.4	17.1	12.6	8.3	5.7	2.3	0.5

Among the main geographic divisions the South Central division has relatively the largest population under 10 years of age, and between 10 and 20 years of age. The North Atlantic division has relatively the largest population between 20 and 30 years of age, and in each of the groups 50 years and over. The Western division has relatively the largest population between 30 and 40 and between 40 and 50 years of age. The relative minima for the various age groups are as follows: Under 10, and 10 to 19, the North Atlantic division; 20 to 29, the North Central division; and each of the higher age groups, the Western division. The age constitution of the North Central division is most nearly representative of that of continental United States as a whole.

The age constitutions of the North Atlantic and the Western divisions are alike, with respect to the small proportion of the population in the first 20 years of life, but for the other age groups there are marked differences between the two divisions. These differences are clearly apparent in Table XXXVIII. It shows that over two-fifths of the population of both the North Atlantic and the Western divisions is more than 30 years old—a larger proportion than in any of the other divisions. But the population 30 years of age and over is distributed very differently for the two divisions. In the North Atlantic division a smaller per cent of this part of the population is less than 60 years of age than in any other division. In the Western division a larger per cent of the population is between 30 and 60 years of age than in any other division; that is, the North Atlantic division contains an unusually large number of persons of advanced age, while the Western division contains an unusually large number of persons in middle life.

TABLE XXXVIII.—*Per cent that population 30 years of age and over forms of the total population of known ages, and per cent that the population between 30 and 60 years of age and 60 years of age and over forms of the population 30 years of age and over, for main geographic divisions: 1900.*

	North Atlantic division.	South Atlantic division.	North Central division.	South Central division.	Western division.
Per cent that population 30 years of age and over forms of total population of known ages	42.1	32.0	38.4	30.2	42.4
Per cent that population between 30 and 60 years of age forms of the population over 30 years	82.0	82.6	82.4	84.5	85.3
Per cent that population 60 years of age and over forms of the population over 30 years	18.0	17.4	17.6	15.5	14.7

It now remains to consider the distribution of the population by 10-year groups for the states and territories. Anything like an adequate discussion of these results would require so much space that it seems best to substitute for such an analysis Table XXXIX, which shows the states and territories in the order of the proportions of their population in the various age groups.

TABLE XXXIX.—RANK OF THE STATES AND TERRITORIES IN THE PER CENT OF THEIR POPULATION OF KNOWN AGES IN SPECIFIED AGE GROUPS: 1900.

RANK.	UNDER 10 YEARS.		10 TO 19 YEARS.		20 TO 29 YEARS.		30 TO 39 YEARS.		40 TO 49 YEARS.		RANK.

The number and proportion of children in the population.—Perhaps the most important and interesting results of the age inquiry are the statistics of the number and proportion of children in the population. These statistics make it possible to come to some knowledge of the rate of the "natural increase" of the population of the different classes and in the same geographic areas. The proportion of children in the population is, of course, primarily a function of the birth rate, but it is also affected by the rate of infant mortality, which varies widely among different classes of the population. The migration of children in the first few years of life is so small as to be, for most purposes, negligible.

Table XL shows the number and proportion of children under 1 year and under 5 years of age, for the censuses of 1900, 1890, and 1880.

TABLE XL.—NUMBER AND PER CENT OF THE TOTAL POPULATION UNDER 1 YEAR AND UNDER 5 YEARS OF AGE, CLASSIFIED BY SEX, RACE, AND NATIVITY, FOR CONTINENTAL UNITED STATES: 1900, 1890, AND 1880.

SEX, RACE, NATIVITY, OR NATIVITY OF PARENTS.	1900				1890				1880

[1] Less than one-tenth of 1 per cent.

Considering first the results for 1900, it appears that the smallest proportion of children in each of the two groups shown in the table is found in the foreign white population, and the largest proportion in the native white population of foreign parents. These figures indicate simply that the proportion of children among our immigrants is small, and that the foreign white population is contributing relatively more to the natural increase of the population than is any other class. This latter fact does not mean necessarily a relatively higher fecundity for the foreign born population, for birth rates are not of much significance unless differences in the sex and age constitution of the various classes of the population are taken into account. The age constitution of the foreign born population is especially favorable to a high birth rate, for, as has been seen, a relatively large proportion of that class of the population is of adult age.

It will be noticed that the per cent of the negro population under 1 year of age is the same as the corresponding per cent for the native white population of native parents. This does not indicate necessarily

that the birth rates of the two classes are approximately equal, for the errors in the reports of children's ages must be taken into account, and these have been shown to be more important for the negro than for any other class of the population. Moreover, infantile death rates are usually large in the same classes of the population in which birth rates are large, a fact which tends to equalize the proportion of children in different classes of the population. In 1900, for the registration area, the ratio of the deaths of children under 1 year of age to 1,000 births was 142.8 for native white children, and 297.0 for colored children.

The proportion of the total population in each of the two age periods under consideration decreased between 1880 and 1900, the decrease being more noticeable for the colored than for the native white population. Comparisons of the figures for 1890 and 1900 would be misleading, because of the abnormal amount of overstatement of children's ages in 1890, and because those tabulated as less than 5 years old in that year included only those children who were reported as less than 4½ years old.

Table XLI shows the number and per cent of the population in these age groups for the most important countries of Europe.

TABLE XLI.—*Number and per cent of the population under 1 year and under 5 years of age, for European countries.*[1]

COUNTRY.	Date of census.	NUMBER.			PER CENT.	
		All known ages.	Under 1.	Under 5.	Under 1.	Under 5.

[1] Compiled from Bertillon, Statistique Internationale.

Only in France, Ireland, Portugal, and Switzerland, of the 16 countries shown in the table, is the proportion of children under 1 year of age less than in the United States. This seems to indicate that "natural increase" is not so important a factor in the growth of the population of the United States as in the majority of European countries. It is probable, however, that in most of these countries the ages of children are reported more accurately than in the United States. It should be remembered, also, that migration of adults has operated to increase the proportion of children in most European countries and to decrease the corresponding proportion in the United States.

Table XLII shows the number and per cent of children under 1 year and under 5 years of age in urban and rural districts.

TABLE XLII.—*Number and per cent of the total population under 1 year and under 5 years of age, classified by sex and as living in cities having at least 100,000 inhabitants, in cities having between 25,000 and 100,000 inhabitants, and in smaller cities or country districts, for continental United States: 1900.*

SEX OR AGE PERIOD.	IN CITIES HAVING AT LEAST 100,000 INHABITANTS.		IN CITIES HAVING BETWEEN 25,000 AND 100,000 INHABITANTS.		IN SMALLER CITIES OR COUNTRY DISTRICTS.	
	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.
Under 1 year:						
Both sexes	317,350	2.2	116,230	2.1	1,483,312	2.7
Males	160,351	2.3	58,437	2.1	750,469	2.6
Females	156,999	2.2	57,793	2.1	732,843	2.7
Under 5 years:						
Both sexes	1,505,471	10.6	549,319	10.0	7,115,838	12.7
Males	757,408	10.8	276,428	10.1	3,599,776	12.4
Females	748,063	10.5	272,891	9.9	3,516,062	12.9

The proportion of children under 1 year of age is smaller in cities of over 100,000 inhabitants and in cities having between 25,000 and 100,000 inhabitants than the corresponding proportion in smaller cities or country districts. The same is true for children under 5 years of age. In each case the difference is more marked for females than for males, but, that false inferences may not be drawn from this fact, it should be noted that in cities having over 25,000 inhabitants 49.8 per cent of the population are males and 50.2 per cent, females. The per cent which the number of children of each sex forms of the total number of children is substantially the same for cities and for rural districts.

Table XLIII shows the number and per cent of the population of each state or territory that is under 1 year and under 5 years of age.

TABLE XLIII.—NUMBER AND PER CENT OF THE TOTAL POPULATION UNDER 1 YEAR AND UNDER 5 YEARS OF AGE: 1900.

California	25,137	125,937	1.7	8.6

While for continental United States as a whole the proportion of children under 1 is 2.5 per cent (or 1 in every 40 of the population), this proportion varies in the individual states from 3.3 per cent (or 1 in every 30) in Utah and Indian Territory to 1.7 per cent (or 1 in every 60) in California and the District of Columbia. The proportion in Pennsylvania, Wisconsin, and Iowa is the same as that for continental United States. The states in which the proportion of children under 1 is greater than it is for continental United States, as a whole, form two well-defined groups. One of these areas includes all of the states east of the Mississippi river and south of the Potomac and Ohio rivers, together with Arkansas, Louisiana, Indian Territory, Oklahoma, Texas, New Mexico, Arizona, Utah, and Idaho. The other group is composed of Wisconsin, Minnesota, North and South Dakota, and Nebraska. The relatively high proportion of children in the states of the South Atlantic and South Central divisions is to be traced to two main causes—the large negro population and the relatively small urban population of this section of the country. Those states of the North Central division in which the proportion of children is relatively large are states that combine a large foreign born population with a relatively small urban population. New Mexico, Arizona, Utah, and Idaho, with their high proportion of children, present a contrast to the other states of the Western division.

All of the states in which less than 2.2 per cent of the population are under 1 year of age, with the exception of Ohio, Nevada, and the District of Columbia, are in New England or on the Pacific coast.

The per cent of children under 5 varies from 15.4 in Indian Territory to 8.3 in the District of Columbia. In Wisconsin, Arizona, and Iowa the per cent of children under 5 is approximately the same as in continental United States as a whole (12.0 per cent). In general the rank of the states with reference to the proportion of children under 5 is about the same as their rank with reference to the proportion of children under 1. The greatest variations are found in New Mexico, which ranks sixth among the states in the percentage of children under 1 and only fourteenth in the percentage under 5; in Mississippi, ranking fourteenth and seventh, respectively; and in West Virginia, seventh and thirteenth, respectively. The significance of these proportions as indicative of the fecundity of the population of different classes and areas should not be overestimated. Other things being equal, the number of children in the population will vary, not

only with the infantile death rate, but also with the proportion of females in the population, the proportion of those who are married, and the proportion of married women who are of child-bearing age. Accordingly, a more significant proportion is that of the number of children in the population to the number of married women of child-bearing age. The presentation of such ratios, however, lies outside the scope of the present study.

Other age groups.—Adequate discussions of the population of military age, voting age, and school age will be found in Twelfth Census, Volume II.

The proportions of the sexes in different age groups.—The tables hitherto considered have shown the per cent of the total population of each sex who are in specified age groups. Table XLIV shows the percentage that the number of each sex forms of the total population in specified groups.

TABLE XLIV.—*Per cent of each sex in specified age, race, and nativity groups, for continental United States: 1900.*

90 to 94 years	41.1	58.9	40.5	59.5	44.0	56.0	39.4	60.6
95 to 99 years	38.6	61.4	34.7	65.3	43.1	56.9	39.4	60.6
100 years and over	36.3	63.7	34.1	65.9	45.5	54.5	34.7	65.3

The interpretation of the results shown in Table XLIV is closely dependent upon the facts with reference to the proportion of the sexes at birth. The census obtains the total number of births by adding to the number of children reported as less than a year old at the date of the census the number of deaths of children who, if they had survived, would have been less than a year old at the census date. For the registration area the deaths of children under 1 year are abstracted from the state or city registration returns; for the rest of the United States they are obtained by the census enumerators. The reports show that of all births in the United States during the twelve months preceding the taking of the census of 1900, 51.2 per cent were of males. For the registration area the per cent is 51.1. There is reason to believe that this per cent is somewhat too low. In the states of Massachusetts, Connecticut, and Rhode Island the registration of births is fairly complete, and what omissions there are may be supposed to be divided proportionately between the sexes. The proportions that registered male births made of the total number of births in these states for the twelve months preceding the census were as follows: Massachusetts, 51.2; Connecticut, 51.7; Rhode Island, 51.7. The corresponding per cents as returned by the census were: Massachusetts, 50.7; Connecticut, 51.0; Rhode Island, 51.0. It is probable that the true per cent for the United States is nearer 52 than 51. Table XLIV shows that in the native white and foreign white populations this excess of males over females continues for the first three quinquennial age groups, although the excess of males in each of these groups, as well as among children less than a year old, is smaller than the excess of males in the total number of births. In the negro population, on the other hand, there is for children under 1 and in each of the first two quinquennial age groups an excess of females over males. The explanation of these facts is found in the different infantile death rates of the sexes and of the different classes of the population. Of the total number of deaths of children less than a year old among the white population of the registration area 56.3 per cent were of males and 43.7 per cent were of females. The corresponding per cents for the colored population are 53.8 and 46.2. The death rate per 1,000 for white children under 1 in the registration area was 143.4, while the corresponding rate for colored children was 297. It is probable that on account of the overstatement of the ages of children under 1 these death rates are too high, the exaggeration being greater for colored children than for white. However, the fact that there are more females than males less than a year old in the colored population must be attributed to its excessive infantile death rate.

Table XLV shows the death rates of the sexes in different age groups for the registration area. These rates can not be supposed to be accurate, but for the present purpose it is sufficient if they show the relative death rates of the two sexes with approximate accuracy.

TABLE XLV.—*Deaths at specified ages per 1,000 population of same ages, for the registration area: 1900.*

AGE PERIOD.	AGGREGATE.		NATIVE WHITE.		FOREIGN WHITE.		COLORED.	
	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.
Under 1 year	183.7	146.8	175.9	139.8	161.2	136.9	403.9	339.7
Under 5 years	56.7	47.5	54.5	45.4	36.2	33.2	127.2	110.2
5 to 14 years	4.4	4.2	4.2	4.0	3.9	3.6	9.2	10.2
15 to 24 years	6.7	6.1	6.2	5.7	6.1	5.1	17.2	14.4
25 to 34 years	9.5	8.5	9.3	8.2	8.4	7.9	18.2	15.6
35 to 44 years	12.4	10.5	11.7	9.7	12.3	10.8	21.5	20.4
45 to 64 years	24.1	20.1	20.1	16.8	28.0	23.4	38.6	34.6
65 years and over	91.1	82.6	88.1	78.0	93.1	87.6	119.8	100.3

It is evident that the facts as to death rates shown in Table XLV can not explain the facts shown in Table XLIV. According to Table XLV the death rate of the aggregate population in every age group is higher for males than for females. This seeming inconsistency is due to the fact that the registration area is not fairly representative of continental United States as a whole, since it contains a disproportionately large urban population. In the registration area 59 per cent of the population are in cities of over 8,000 population, and 49 per cent are in cities of over 100,000 population. The corresponding per cents for continental United States are 31 and 19. Table XLVI shows the death rates of the two sexes, classified by age periods, for the population of the rural parts of registration states (including all towns and cities of less than 8,000 population).

TABLE XLVI.—*Deaths at specified ages per 1,000 population of same ages for the rural parts of registration states: 1900.*

AGE PERIOD.	AGGREGATE.		NATIVE WHITE.		FOREIGN WHITE.		COLORED.	
	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.
Under 1 year	131.0	103.6	129.5	102.3	106.8	121.9	246.9	191.4
Under 5 years	37.6	31.2	37.3	30.8	26.9	27.3	70.6	63.6
5 to 14 years	3.2	3.2	3.1	3.1	4.1	3.3	5.6	6.4
15 to 24 years	5.2	5.3	5.1	5.3	5.2	5.0	6.0	9.5
25 to 34 years	6.4	7.3	6.6	7.4	5.4	6.9	8.4	10.0
35 to 44 years	7.8	8.2	7.7	8.0	8.3	8.7	9.6	13.5
45 to 64 years	16.0	15.4	15.1	14.8	18.3	17.0	20.6	22.5
65 years and over	80.0	73.6	80.1	72.5	79.7	77.4	79.8	68.9

Table XLVI shows that in the rural districts, throughout the period of middle life, the mortality of males is less than that of females.

This throws light on the results shown in Table XLIV. In the native white population there are more males than females in each group below 15 years, but owing to the higher death rate of males in the period of childhood and youth the groups of 15 to 19 and 20 to 24 years show an excess of females. During the period of middle life the higher death rate of females in the rural districts seems to overbalance the higher urban death rate of males, for each of the age groups between 25 and 75 years contains more males than females. In the period of old age the mortality of males is greater than that of females in both cities and rural districts, so that the age groups composed of the years of life above 75 show a marked excess of females, this excess increasing as age advances.

In the colored population the higher death rate of females begins at an earlier age than in the native white population, so that the group 10 to 14 years in the negro population (which constitutes 96.2 per cent of the colored population of continental United States) contains more males than females. With the exception of the group 30 to 34 years, in which the numbers of the two sexes are approximately equal, each group between 15 and 45 years contains more females than males. In view of the fact that the negro population is preeminently a rural population (only 12.9 per cent of the negro population of continental United States living in cities of over 25,000 inhabitants, as against 27.7 per cent for the white population), it seems difficult to explain this excess of females in early middle life. All the registration states, with the exception of the District of Columbia, are in the North Atlantic or North Central divisions, and it is quite possible that the small colored population in these states is not fairly representative of the large negro population of the South. However, examination of the returns for the nonregistration area does not clear up the difficulty, for in each quinquennial age group between 10 and 50 years more deaths of females than of males are reported for the colored population.[1] These returns are admittedly incomplete, but there is no a priori reason to suspect that the error is a biased one. It may be thought that the death rates of 1900 are not fairly representative of those of past years, which have been the factors in shaping the present age and sex constitution of the negro population. An examination of the returns for the censuses of 1890 and 1880, however, shows that there has been no marked change in the age and sex distribution of the mortality of the colored population.[2] The population and mortality returns seem in this particular to be irreconcilable. It is possible that during the period of middle life the deaths of females are reported more accurately than those of males.

The proportion of the sexes in the foreign white population in different age groups depends on the relative numbers of the two sexes among the immigrants of various ages, as well as upon their relative death rates. In view of this fact it is remarkable that the results presented for the foreign white population shown in Table XLIV show so small a deviation from those for the native white population. The excess of males in the total foreign white population is greater than in the total native white population, but this greater excess is confined to that part of the foreign white population which is in the age periods comprising the years of life above 25. The majority of the foreign white population, as of the native white population, in the groups 15 to 19 and 20 to 24 years are females.

The sex distribution of the population in different age groups for cities and rural districts is shown in Table XLVII.

TABLE XLVII.—*Per cent distribution, by sex, of population of specified age in cities having at least 100,000 inhabitants, in cities having between 25,000 and 100,000 inhabitants, and in smaller cities or country districts, for continental United States: 1900.*

AGE PERIOD.	IN CITIES HAVING AT LEAST 100,000 INHABITANTS.		IN CITIES HAVING BETWEEN 25,000 AND 100,000 INHABITANTS.		IN SMALLER CITIES OR COUNTRY DISTRICTS.	
	Per cent male.	Per cent female.	Per cent male.	Per cent female.	Per cent male.	Per cent female.
All known ages	49.7	50.3	49.7	50.3	51.5	48.5
Under 5 years	50.3	49.7	50.3	49.7	50.6	49.4
Under 1 year	50.5	49.5	50.3	49.7	50.6	49.4
1 to 4 years	50.3	49.7	50.3	49.7	50.6	49.4
5 to 9 years	50.1	49.9	50.0	50.0	50.6	49.4
10 to 14 years	49.6	50.4	49.2	50.8	50.8	49.2
15 to 19 years	47.3	52.7	47.3	52.7	50.4	49.6
20 to 24 years	46.5	53.5	47.0	53.0	50.5	49.5
25 to 29 years	49.1	50.9	49.6	50.4	51.7	48.3
30 to 34 years	51.6	48.4	51.6	48.4	52.5	47.5
35 to 44 years	52.6	47.4	52.3	47.7	53.1	46.9
45 to 54 years	51.1	48.9	51.3	48.7	53.9	46.1
55 to 64 years	48.9	51.1	48.7	51.3	52.4	47.6
65 years and over	44.9	55.1	45.2	54.8	52.0	48.0

In every group of the age classification used in Table XLVII there are, in "smaller cities or country districts," more males than females. If the period of 65 years and over, however, could be subdivided into smaller groups, it is quite certain that more females than males would be found in the groups comprising the more advanced ages. In cities there are more females than males in each of the groups of age between 10 and 30 years and in each of the groups for 55 years and over. This difference between the constitution of the population of cities and rural districts is due partly to differences in the numbers and ages of male and female migrants from the rural districts to the cities, and partly to differences in rural and urban death rates. Table XLVIII shows the death rates of the population in specified age groups for the registration cities not in registration states. These cities are selected because they are more characteristically urban than the cities in registration states. All places of more than 8,000 inhabitants in which sufficiently accurate records of deaths are kept are "registration cities," but 70 per cent of the population of such of these cities as are not in registration states are in cities of more than 100,000 inhabitants.

TABLE XLVIII.—*Deaths at specified ages per 1,000 of the aggregate population of same ages, classified by sex, for registration cities not in registration states: 1900.*

SEX.	Under 1 year.	Under 5 years.	5 to 14 years.	15 to 24 years.	25 to 34 years.	35 to 44 years.	45 to 64 years.	65 years and over.
Males	194.0	60.4	5.2	8.1	10.8	14.4	28.9	103.8
Females	156.0	50.8	4.9	6.9	9.1	11.4	21.6	88.7

Upon a comparison of the rates shown in Table XLVIII with those shown in Table XLVI for the aggregate population of the rural parts of registration states, it appears that for each age group the death rate is higher in cities than in rural districts. Moreover, in cities the mortality of males is greater than that of females for every age group, while in the rural districts the death rate of females, as already mentioned, is higher than that of males for the years of life between 15 and 45. The higher death rate of males accounts, in part at least, for the fact that in the urban population between the ages of 10 and 20 there are more females than males. However, the differences between the death rates of the two sexes for the age groups comprising the years of life between 5 and 35 are so slight that this excess of females suggests that women between 15 and 25 years old migrate to the cities in greater numbers than do men of corresponding ages. Our statistics do not afford any absolute proof of this theory. In Europe, however, it is indisputably a fact.[1]

Notwithstanding the fact that the differences between the mortality of males and females in cities are greater for the period 35 to 64 years than for the period 5 to 34 years, males are more numerous than females in the groups 30 to 34, 35 to 44, and 45 to 54 years. This fact can be explained only on the supposition that more males than females among persons of adult age migrate from the country to the city.

APPENDIX A.

THE ADJUSTMENT OF THE RETURNS.

For most of the purposes to which census age returns are put, groups of five, ten, or more years are sufficiently detailed, and the discussion of the subject of errors has shown that such groups, when formed with due attention to the nature of the errors in the returns, may be supposed to represent the actual age constitution of the population with reasonable accuracy. It may happen, however, that for some purposes—such as the construction of a life table—it becomes necessary to know the number of persons in a given year of life. In such cases the errors in the returns stand in the way of satisfactory results. For this reason attempts have been made in various countries to modify the census returns in such a way as to eliminate as many of these errors as possible.

In some ways the problem is similar to that with which actuaries have to deal in the construction of life tables based on the experience of life insurance companies. On the other hand, however, there is a distinct difference between the two problems. The errors in the unadjusted life tables are accidental errors arising from paucity of observations; that is, they would be eliminated if the number of observations were indefinitely large. The errors in the census age tables are systematic errors and take certain definite forms. The formulas employed in the adjustment of life tables are usually based on the theory of errors, and consequently can not be applied to the census returns, for until known errors are eliminated the law of error is not applicable. This point is mentioned, because in several instances formulas based on the theory of errors have been used in the adjustment of census age returns.[1]

The thing to be desired in an adjustment of the age returns is a smooth series that will adhere as closely as possible to the facts. The aim should be to eliminate irregularities caused by misstatement of age, while retaining those corresponding to actual irregularities in the age constitution of the population. An accurate selection of this kind is, of course, impossible, but it should be noted that (in a graphic representation of the age returns) real irregularities would usually take the form of flexures covering a period of several terms of the series, while the irregularities caused by errors are more likely to appear as angular deflections, corresponding to abnormal values of single terms. It has already been shown that groups of terms are more liable to be accurate than are single terms, and especially is this the case when the groups are so constituted that the probability of the equality of positive and negative errors is a maximum. To obtain the closest agreement with the facts such groups should contain as few terms as considerations of accuracy will permit. The discussion of age groups has shown that the quinquennial groups in which the lowest year is a multiple of 5 fit these conditions as closely as any others. Hence, in the present adjustment, it has been thought best to retain the different quinquennial groups intact, and simply to redistribute the numbers at the various ages within each group. The fact that the groups containing multiples of 10 are somewhat larger, relatively, than groups containing odd multiples of 5 leads to some irregularities in the adjusted series, but it has been thought that these are more than counterbalanced by the advantages of the agreement of corresponding groups of terms of the adjusted and unadjusted series. The method of adjustment used has been adapted from that used in the English census. Intermediate values were interpolated by the method of differences in the series $\log Q_5$, $\log Q_{10}$, $\log Q_{15}$, $\log Q_{20}$, etc., in which Q_x represents the number reported at and above the age x. After the adjusted numbers at and above each age had been found in this manner, the number at each age was obtained by subtraction. A separate interpolation was made for each sex of the native white population of native parents, the native white population of foreign parents, the foreign white population, and the colored population. The results for both sexes, for the native white population, and for the aggregate population, were then obtained by the proper additions. For the groups 5 to 9, 90 to 94, and 95 to 99 Newton's coefficients were used, while Bessel's coefficients were used for all the other groups. In both formulas five orders of differences were used. The ages under 5 were not included in this adjustment, because the mortality in the first few years of life is so high that an adjustment of these years based on the progression of the Q_x series taken at quinquennial intervals would distort the facts.

[1] For a list of such adjustments, as well as a general treatment of the subject under discussion, see an article by the present writer on "The adjustment of census age returns," in the Western Reserve University Bulletin, November, 1902.

RACE.

SUMMARY OF RESULTS.

In continental United States each of the four main races of the world is largely represented as follows: 66,809,196 or 87.9 per cent white, or Caucasian; 8,833,994 or 11.6 per cent black, negro, or African; 237,196 or 0.3 per cent red, or Indian; and 114,189 or 0.2 per cent yellow, or Mongolian.

In continental United States the numerical predominance of the white race increased slightly at the expense of each other race, and thus the population became slightly more homogeneous racially between 1890 and 1900.

In each outlying district there is a numerous non-Caucasian population, but in Alaska it is mainly Indian, in Hawaii mainly Mongolian, in the Philippine Islands substantially all Malay, and in Porto Rico substantially all negro. Among these districts the Philippine Islands are least Caucasian and Porto Rico most so in the race composition of the population.

While in continental United States the great majority of the population is white, in every outlying district except Porto Rico the whites are in the minority and in Porto Rico only a little over three-fifths of the population are whites.

The proportion of whites in the total population is greatest in the New England, Eastern North Central, and Southern North Atlantic divisions in the order named. The proportion decreased between 1890 and 1900 in these three and in the Eastern South Central division; it increased in the other seven minor geographic divisions.

Outside the South, where the great mass of the negroes is found, the per cent negro in the total population is greatest in the Western North Central, Southern North Atlantic, and Eastern North Central divisions. Between 1890 and 1900 the per cent negro increased only in New England, the Southern North Atlantic, and the Eastern North Central divisions.

The per cent Indian in the total population is much greater in the Basin and Plateau than in any other minor geographic division. The per cent decreased between 1890 and 1900 in substantially all parts of the country.

The per cent Mongolian in the total population is greatest in the Pacific division and appreciable only in the other two parts of the Western division, namely, the Basin and Plateau and the Rocky Mountain divisions. In all three the proportion of Mongolians decreased between 1890 and 1900, while it increased in every division on the Atlantic coast, especially in New England and the Southern North Atlantic division.

In continental United States Indians are about twice as numerous as Mongolians. The number of each is greatest in the Western division. Indians are more numerous in the Central than in the Atlantic divisions.

Indians, unlike Mongolians, are much less numerous in cities having at least 25,000 inhabitants than in smaller cities or country districts.

Of the Mongolians in continental United States practically one-half (49.0 per cent) are in California and more than two-thirds (68.3 per cent) are in this and the adjoining states of Oregon and Washington.

The Mongolians are substantially confined to the Western division, every state in that division having a larger proportion of Mongolians in its population than any state of the Atlantic or Central divisions, except the District of Columbia.

However, they have been dispersing over the country in the last ten years. In 1890 nine-tenths, but in 1900 only eight-tenths, of the Mongolians were residents of the Western division, while, on the other hand, the proportion increased in each of the remaining divisions, especially the North Atlantic, the division with the largest urban population.

In continental United States the Chinese are decreasing in numbers, while the Japanese are rapidly increasing. The proportion of Japanese among all Mongolians rose from only about one-fiftieth in 1890 to over one-fifth in 1900.

In 1890 nine-tenths of the Chinese in this country were in the Western states, but in 1900 only three-fourths were there, the others having moved mainly to the North Atlantic states. On the other hand, while only three-fourths of the Japanese were in the Western division in 1890, over nineteen-twentieths were there in 1900, and this not because of any decrease in the number in the rest of the country but because of the

great increase in the Western division. The Japanese population in California, notwithstanding its recent arrival, is disseminated over the state more evenly than the Chinese or the entire population.

DISCUSSION OF RACE.

Nature of returns.—The primary object of the American census has always been to furnish the numerical basis for the apportionment of Representatives. This appears clearly in the provision of the Constitution:

> Representatives . . . shall be apportioned among the several states . . . according to their respective numbers, which shall be determined by adding to the whole number of free persons, . . . excluding Indians not taxed, three-fifths of all other persons.

These words furnish the basis for the race distinctions which have been included in the census from the beginning. "All other persons" besides the free were the slaves; and, as the Indians as a class were never enslaved, the slaves were of negro blood, pure or mixed. To ascertain the three-fifths required it was necessary to enumerate them. As the Indians not taxed were not to be considered for purposes of apportionment, it was not necessary to include them in the population. From 1790 to 1860 the distinction of race between white and negro was very closely interlaced with the distinction of status between free persons and slaves. But, as all whites and some negroes were free, the negro race was divided into two parts according to the status, a large majority being slaves and the remainder free. It is noteworthy that words indicating race classification in the earlier census returns are subsidiary to words indicating status. This appears from the following summary of the classifications employed:

1790. Free whites, all other free persons, and slaves.
1800 and 1810. Free whites, all other free persons except Indians not taxed, and slaves.
1820. Same as 1810, with the addition of a class of free colored persons.
1830 and 1840. Omitted from the four classes of 1820 the class of all other free persons except Indians not taxed.
1850. Added to the three classes of 1830 and 1840 the further division of the colored into blacks and mulattoes, this classification of the population not being published until the appearance of the following census.
1860. Added to the four classes of 1850 a new class "civilized [that is, taxed] Indians." The Asiatics in California were returned with the whites, but distinguished in a footnote.
1870. The class of slaves disappeared. To the other four classes of 1860 was added "Chinese." The few Japanese were classed with the Chinese, but distinguished in footnotes.
1880. The five classes of 1870 were changed by omitting the class of mulattoes and adding the class of Japanese.
1890. The five classes of 1880 were changed by dividing the negroes into blacks, mulattoes, quadroons, and octoroons.
1900. The five classes of 1880 were employed, figures being presented for whites, negroes, Indians (taxed and not taxed), Chinese, and Japanese.

The census practice of the United States on the subject of race differs from that of all the countries of Europe, in none of which, I believe, is such a distinction made.

Definition of terms.—The word "race" is used in popular speech with much looseness. It is often extended to include all mankind, as in the phrase "the human race;" and it is often confined to a small division of the human race, the unity of which consists largely, if not mainly, in identity of language, as "the Anglo-Saxon race," or "the German race." In the third volume of the Twelfth Census "race" is thus used to include "nationality as indicated by the country of birth."[1] For purposes of this report its meaning lies between these two extremes. It may be defined as an "ethnical stock or a great division of mankind having in common certain distinguishing physical peculiarities." These physical peculiarities must be so marked as to render it easy for the enumerator, at least in the majority of cases, to determine by simple observation to what race the person to whom he is addressing his questions belongs. The oldest and most familiar physical test by which races are distinguished is that of skin color. Whether or not it is the most important to the ethnologist, it is certainly the one which the enumerator finds easiest to apply. This test in a country like the United States, which contains many members of the white race, the black race, the red race, and the yellow race, with obvious race characteristics not effaced or completely obscured by race intermixtures, gives fairly accurate results even in the hands of more than 50,000 untrained enumerators. But there seems to be little scientific ground for attempting to discriminate between the Chinese and Japanese as of different races. They regard themselves and are regarded by ethnologists as closely related branches of the great Mongolian, or yellow, race. There are, then, within the boundaries of continental United States numerous representatives of each of the four main races into which the population of the earth is ordinarily divided, namely: The white, or Caucasian; the black, negro, or African; the red, or Indian; and the yellow, or Mongolian; and these four races have been discriminated by the enumerators of the present census. Most ethnologists who believe that there are five rather than four main races in the world add to the foregoing list the brown, or Malay race. Of this race 6,930,299, or about one-sixth of the probable number in the world, are now living in the Philippine Islands under the American flag.

In the censuses from 1820 to 1880, inclusive, the word "colored" was applied to the population of African blood, pure or mixed, and the word "negro" was little

[1] Twelfth Census, Vol. III, page lxix, column 1.

used. This meaning of colored corresponds approximately to the legal definition in the statutes of some Southern states—"a person who has one-eighth or more of negro blood." In the Eleventh Census the word "colored" was mainly but not exclusively used as a generic term for all races other than white recognized by the census. In the usage of the English West India Islands the term "colored" means persons of mixed white and black blood.[1] The ambiguity of the word and the fact that it can be avoided without difficulty have led the writer to discard it for the present report. On the other hand, the word "negro," formerly avoided, has now been accepted by some of the ablest representatives of the African race, and will be made the usual designation of the black race.

As the "Instructions to Enumerators" issued at the Twelfth Census did not give any definitions of race terms, the enumerators, in determining the race of persons within their enumeration districts, were left to their own interpretation. Their answers reflect local opinion, and that opinion probably is based more upon social position and manner of life than upon the relative amounts of blood.[2] In the application of race terms local usage and judgment vary, and accordingly there is no definition applicable throughout the United States of the words employed by the enumerators. Perhaps "negro" may be interpreted in the light of the statutes against miscegenation in many Southern states whereby intermarriage is prohibited between white persons and persons having one-eighth or more of negro blood. At least this seems the only available means of interpreting the word precisely. It might be wise in future census work to attempt a rough guidance of the enumerators by some such definitions as the following:

White: A person at least seven-eighths of white or Caucasian blood and regarded in the community as belonging to the white race.

Negro: A person at least one-eighth of negro, or African, blood, more negro than Indian or Mongolian, and regarded in the community as a negro.

Indian: A person at least one-eighth of Indian blood, more Indian than negro or Mongolian, and regarded in the community as an Indian.

Mongolian: A person at least one-eighth of Chinese or Japanese blood, more Mongolian than Indian or negro, and regarded in the community as Chinese or Japanese.

By the Twelfth Census, for the first time in sixty years, no effort was made to enumerate separately any classes of half-breeds and no statement was made in the "Instructions to Enumerators" regarding the treatment to be accorded such persons. This question is of importance, mainly with reference to the two leading races in the United States, the white and the negro, and in that case the enumerators probably follow local opinion in classing as negroes all persons predominantly white, but with a perceptible trace of negro blood. Many persons living along the Mexican boundary, speaking the Spanish language and wearing European clothes, but largely, perhaps predominantly, of Indian blood, have probably been returned by the enumerators as whites, the word Indian being reserved by local usage for descendants of the wild hunting and nomadic Indians.

United States.—The race composition of the population of the wild tribes of the Philippine Islands and of the population of Guam and Samoa is not known with any approach to accuracy, but for the rest of the United States, comprising the area of enumeration, the Philippine Islands exclusive of the wild tribes, and Porto Rico, and including 99.2 per cent of the population of the country, the statistics of race have been ascertained. This area includes 84,244,316 persons, of whom 67,594,485 or 80.3 per cent are whites; 9,205,550 or 10.9 per cent are negroes; 6,930,299 or 8.2 per cent are Malays; 266,760 or 0.3 per cent are Indians; and 247,222 or 0.3 per cent are Mongolians. A city having a population of 10,000, the race composition of which agreed with the average for the United States, would contain 8,023 whites, 1,093 negroes, 823 Malays, 32 Indians, and 29 Mongolians.

Outlying districts.—The outlying districts for which the race composition of the population is known—Alaska, Hawaii, the Philippine Islands, and Porto Rico—differ widely in this respect from one another. Each has a numerous non-Caucasian population, but in Alaska it is mainly Indian, in Hawaii mainly Mongolian, in the Philippine Islands substantially all Malay, and in Porto Rico substantially all negro. This appears clearly from the following table.

[1] While this meaning has not received general lexicographic indorsement in the United States, it is employed in the official publications of several of those islands and it is regarded by R. T. Hill as its correct signification. See his "Cuba and Puerto Rico," page 103.

[2] For example, the Croatans, about 4,000 of whom live in Robeson county, N. C., and the adjacent counties, were reported in 1900 as Indians. (Twelfth Census, Vol. I, pages cxxiv and 551.) They are said, however, to be "generally white, showing the Indian mostly in action and habits," and to be characterized by "such admixture as to confuse every inquirer who has undertaken to solve their relations and the numbers of those rightfully claiming any defined racial distinctions." (Eleventh Census, Report on Indians, pages 499 and 500.) In 1890 they were reported as whites.

TABLE I.—POPULATION CLASSIFIED BY RACE, AND PER CENT DISTRIBUTION BY RACE, FOR OUTLYING DISTRICTS ABOUT 1900.

DISTRICT.	Date of census.	POPULATION.										
		Total.	White.	Negro.	Indian.	Mongolian.	Malay.	Per cent white.	Per cent negro.	Per cent Indian.	Per cent Mongolian.	Per cent Malay.
Alaska	1900	63,592	30,493	168	[1]29,536	3,395	.....	48.0	0.3	46.4	5.3	.....
Hawaii	1900	154,001	66,890	233	.....	86,878	.....	43.4	0.2	.....	56.4	.....
Philippine Islands[2]	1903	6,987,686	14,271	1,019	.....	42,097	[3]6,930,299	0.2	(4)	.....	0.6	99.2
Porto Rico[5]	1899	953,243	589,426	363,742	.....	75	.....	61.8	38.2	.....	(4)	.....

[1] Includes 2,499 persons of mixed parentage—that is, of native Indian and Russian, or other parentage.
[2] Census of the Philippine Islands, 1903, Vol. II, page 14.
[3] Includes 15,419 persons reported as being of mixed parentage.
[4] Less than one-tenth of 1 per cent.
[5] War Department Census of Porto Rico, 1899, page 56.

In Alaska the whites, although now the most numerous race, are fewer than Indians and Mongolians together; in Hawaii the whites, including the Hawaiians and part Hawaiians, are little more than three-fourths of the Mongolians; in Porto Rico the whites are over three-fifths and the negroes less than two-fifths of the population; in the Philippine Islands comparatively few persons belong to other than the Malay race, which includes 99.2 per cent of the population.

The Philippine Islands are least Caucasian and Porto Rico most so in the race composition of the population.

Continental United States.—After the outlying districts are excluded the race composition of the population of continental United States is as follows:

RACE.	Number.	Per cent.
Total	75,994,575	100.0
White	66,809,196	87.9
Negro	8,833,994	11.6
Indian	237,196	0.3
Mongolian	114,189	0.2

This exclusion of the outlying districts increases the predominance of the white race in the figures. In a city of 10,000 inhabitants, the race composition of which agreed with the average for continental United States, there would be 8,791 whites, 1,163 negroes, 31 Indians, 15 Mongolians, and no Malays. Comparison of these figures with those for a city agreeing with the average for the United States, including Alaska, Hawaii, the Philippine Islands, and Porto Rico, shows that the predominance of the white race on the mainland is in marked contrast to its numerical inferiority in the outlying districts. The per cents for 1890 and 1900 in Table II show that during that decade the relative predominance of the white race in the United States increased at the expense of each other race. In an average 10,000 people in 1900 there were 27 fewer negroes, 8 fewer Indians, 2 fewer Mongolians, and 37 more whites than in 1890. The racial homogeneity of the population of continental United States has slightly increased during the only ten years for which it can be exactly measured.

Geographic divisions.—A table will be found in the Abstract of the Twelfth Census, pages 40 and 41, giving the number of members of each of the four races residing in each state, territory, or main geographic division of continental United States in 1900 and 1890. For the purpose of the present discussion that table is almost adequate. It has, however, been supplemented by figures for the minor geographic divisions in 1890 and 1900, and also by a computation of the per cent of the entire population belonging to each of the four races at each census. These per cents, owing to their small amount in the case of the Indian and the Mongolian races, have been computed, contrary to the usual practice of the Bureau of the Census, to the second decimal place.

Table II shows that at each census the proportion of white to total population was greatest in New England, followed by the Eastern North Central and the Southern North Atlantic divisions, in the order named. The proportion was lowest in the Southern South Atlantic division and next in the Eastern South Central both in 1890 and 1900. The per cent of whites in the total population increased from 87.54 in 1890 to 87.91 in 1900, increases appearing in all of the 11 minor geographic divisions except 4, the New England, Southern North Atlantic, Eastern North Central, and Eastern South Central divisions.

Outside the South, where the great bulk of the negroes are found, the per cent negro in the total population was greatest at each census in the Western North Central, Southern North Atlantic, and Eastern North Central divisions, in descending order. The proportion of negroes was lowest in the Basin and Plateau and next lowest in the Pacific, Rocky Mountain, and New England divisions. Between 1890 and 1900 the per cent of negroes in the total population increased only in the New England, Southern North Atlantic, Eastern North Central, and Eastern South Central divisions.

TABLE II.—POPULATION CLASSIFIED BY RACE, AND PER CENT DISTRIBUTION BY RACE, FOR MINOR GEOGRAPHIC DIVISIONS: 1900 AND 1890.

DIVISION AND CENSUS.	POPULATION.								
	Total.	White.	Negro.	Indian.	Mongolian.	Per cent white.	Per cent negro.	Per cent Indian.	Per cent Mongolian.
1900

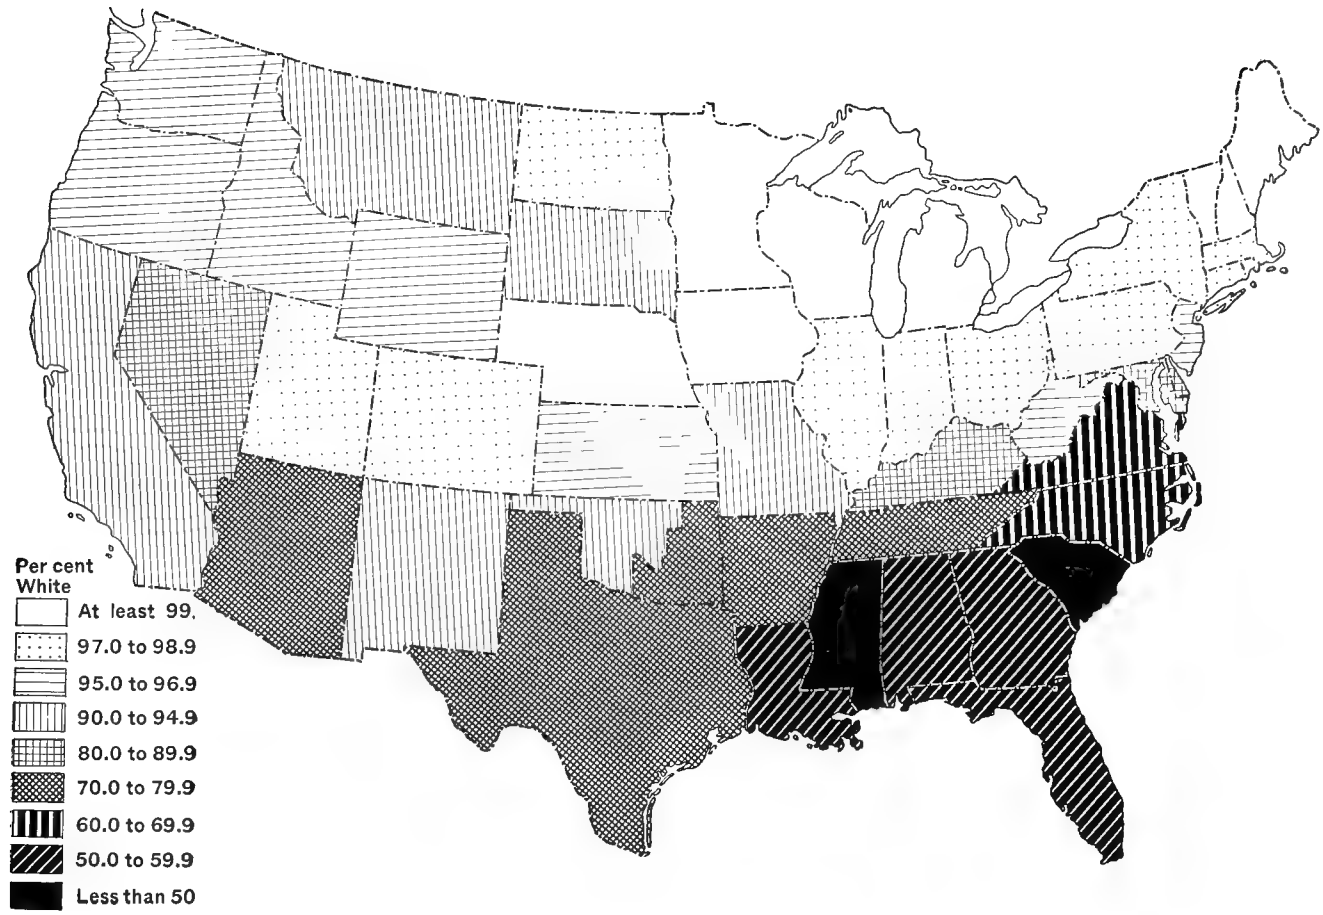
[1] Includes population of Indian Territory and Indian reservations.

[2] Less than one-hundredth of 1 per cent.

The per cent of Indians in the total population was much greater at each census in the Basin and Plateau group than in any other minor geographic division, the divisions next in order being the Rocky Mountain, Pacific, and Western South Central. The per cent of Indians in the total population of continental United States decreased from 0.39 in 1890 to 0.31 in 1900, decreases appearing in substantially all parts of the country.

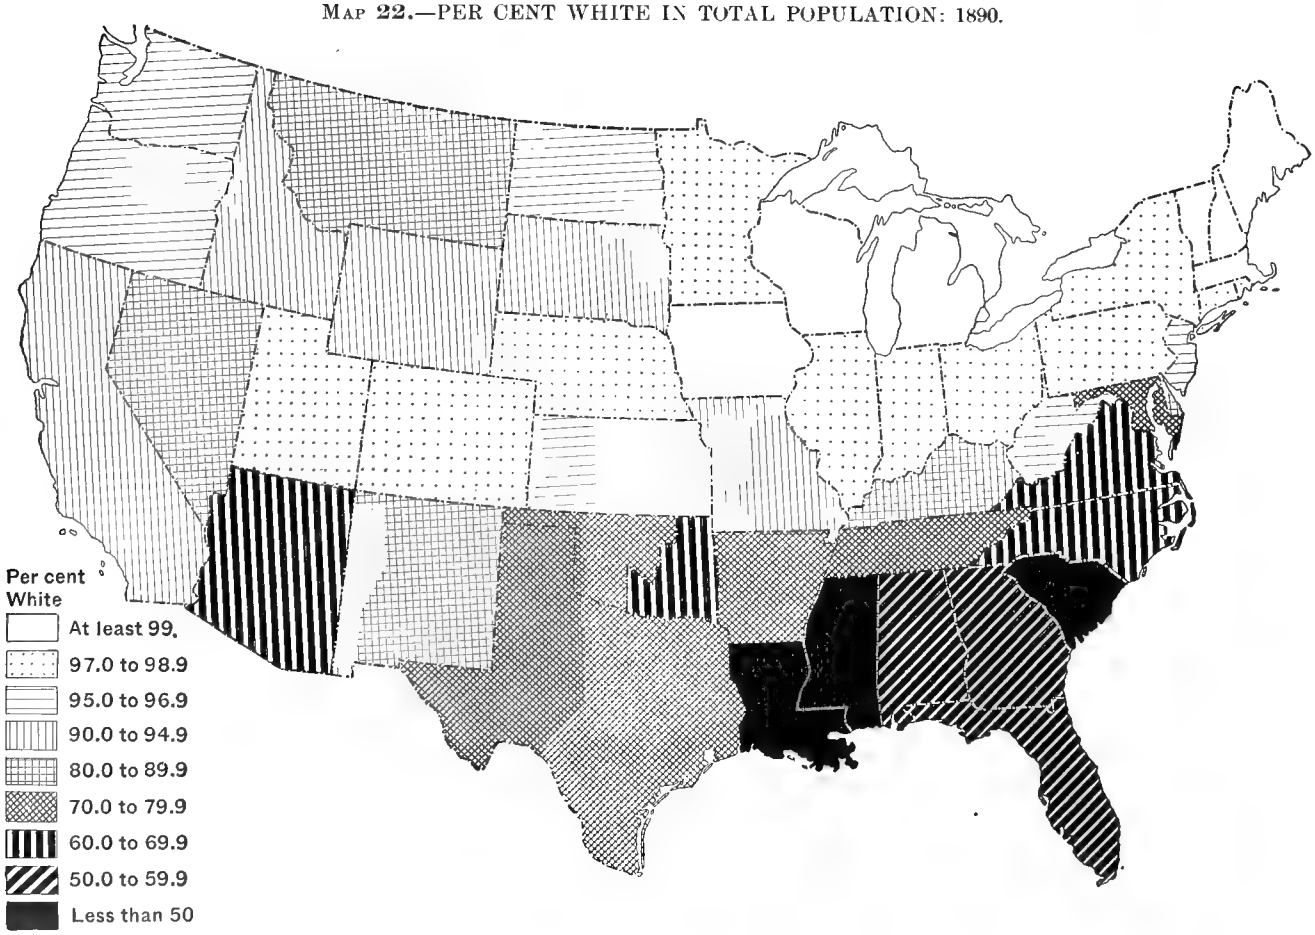
At both censuses the per cent of Mongolians in the total population was greatest in the Pacific division and appreciably great only in the Basin and Plateau and the Rocky Mountain divisions besides. Between 1890 and 1900, however, the proportion of Mongolian to total population decreased in all three of these divisions, while on the other hand it increased in every division on the Atlantic coast, especially in the New England and Southern North Atlantic divisions.

Whites.—On the two maps which follow the per cent of whites in the total population of the several states and territories is indicated for 1890 and 1900.



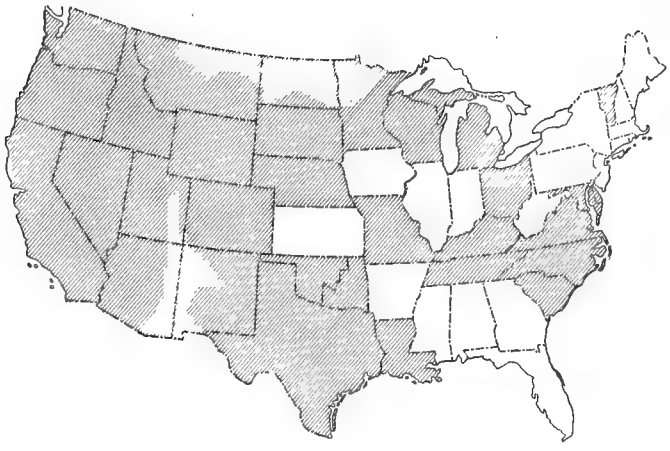
Marking first the map for 1900 it appears that the states with least other than white blood lie along the northern boundary from Maine to Minnesota, New York being the most conspicuous exception to the rule that all such states have a population more than 99 per cent of whom are white. Iowa and Nebraska are in the same class. The states with 97 to 99 per cent of their population white include all others north of Mason and Dixon's line and the Ohio river except New Jersey, and also three west of the Mississippi river, namely, North Dakota, Colorado, and Utah. The states with 95 to 97 per cent of their population white include, east of the Mississippi river, only New Jersey and West Virginia, but five states west of that river—Kansas and four in the far Northwest.

The abruptness of the change in the East between states with a high proportion and those with a low proportion of whites is indicated in the fact that no state east of the Mississippi river has between 90 and 95 per cent of whites in its population. West of that river there are six.



The next group of states, those with 80 to 90 per cent of the population white, includes Delaware, Maryland, Kentucky, and Nevada; the group with 70 to 80 per cent white includes Tennessee, Arkansas, Indian Territory, Texas, and Arizona.

A comparison of the maps for 1890 and 1900 shows that in a number of cases the proportion of white population has increased. Thus the number of states with a minority of whites has decreased from three to two; Indian Territory and Arizona have passed from the 60 to 70 per cent group to the 70 to 80 per cent group. To show more exactly than these maps do the area in which the proportion of whites has increased, Map 23 has been prepared showing the states and territories with a larger proportion of white blood in 1900 than in 1890.



MAP 21.—PER CENT WHITE IN TOTAL POPULATION: 1900.

MAP 22.—PER CENT WHITE IN TOTAL POPULATION: 1890.

MAP 23.—*States with a larger white population in 1900 than in 1890.*

The map shows that in every Western state the proportion of whites increased, 1890 to 1900, and in every North Atlantic state but Vermont the proportion of whites decreased. The South Atlantic division showed an increase of the proportion of whites in each state except West Virginia and Florida. In each of the two central divisions there were three states—Indiana, Illinois, and Iowa in the North, Alabama, Mississippi, and Arkansas in the South—in which the proportion of non-Caucasians increased, 1890 to 1900.

Indians.—The Indians in continental United States are about twice as numerous as the Mongolians, the number of Indians being 237,196 and of Mongolians, 114,189. Their distribution through the main and minor geographic divisions is as follows:

TABLE III.—*Number and per cent distribution of Indian population of continental United States, by division of residence: 1900 and 1890.*

DIVISION.	INDIAN POPULATION.		PER CENT OF INDIAN POPULATION OF CONTINENTAL UNITED STATES LIVING IN SPECIFIED DIVISION.	
	1900	1890[1]	1900	1890[1]
Continental United States	237,196	248,253	100.0	100.0
North Atlantic division	8,559	8,654	3.6	3.5
New England	1,600	1,145	0.7	0.6
Southern North Atlantic	6,959	7,209	2.9	2.9
South Atlantic division	6,585	2,359	2.8	0.9
Northern South Atlantic	400	431	0.2	0.1
Southern South Atlantic	6,185	1,928	2.6	0.8
North Central division	57,366	63,024	24.2	25.4
Eastern North Central	15,027	16,202	6.3	6.5
Western North Central	42,339	46,822	17.9	18.9
South Central division	68,164	69,438	28.7	28.0
Eastern South Central	2,590	3,396	1.1	1.4
Western South Central	65,574	66,042	27.6	26.6
Western division	96,522	104,778	40.7	42.2
Rocky Mountain	31,836	33,409	13.4	13.5

Pacific	30,367	32,776	12.8	13.2

[1] Includes population of Indian Territory and Indian reservations.

MAP 24.—PER CENT INDIAN IN TOTAL POPULATION: 1900.

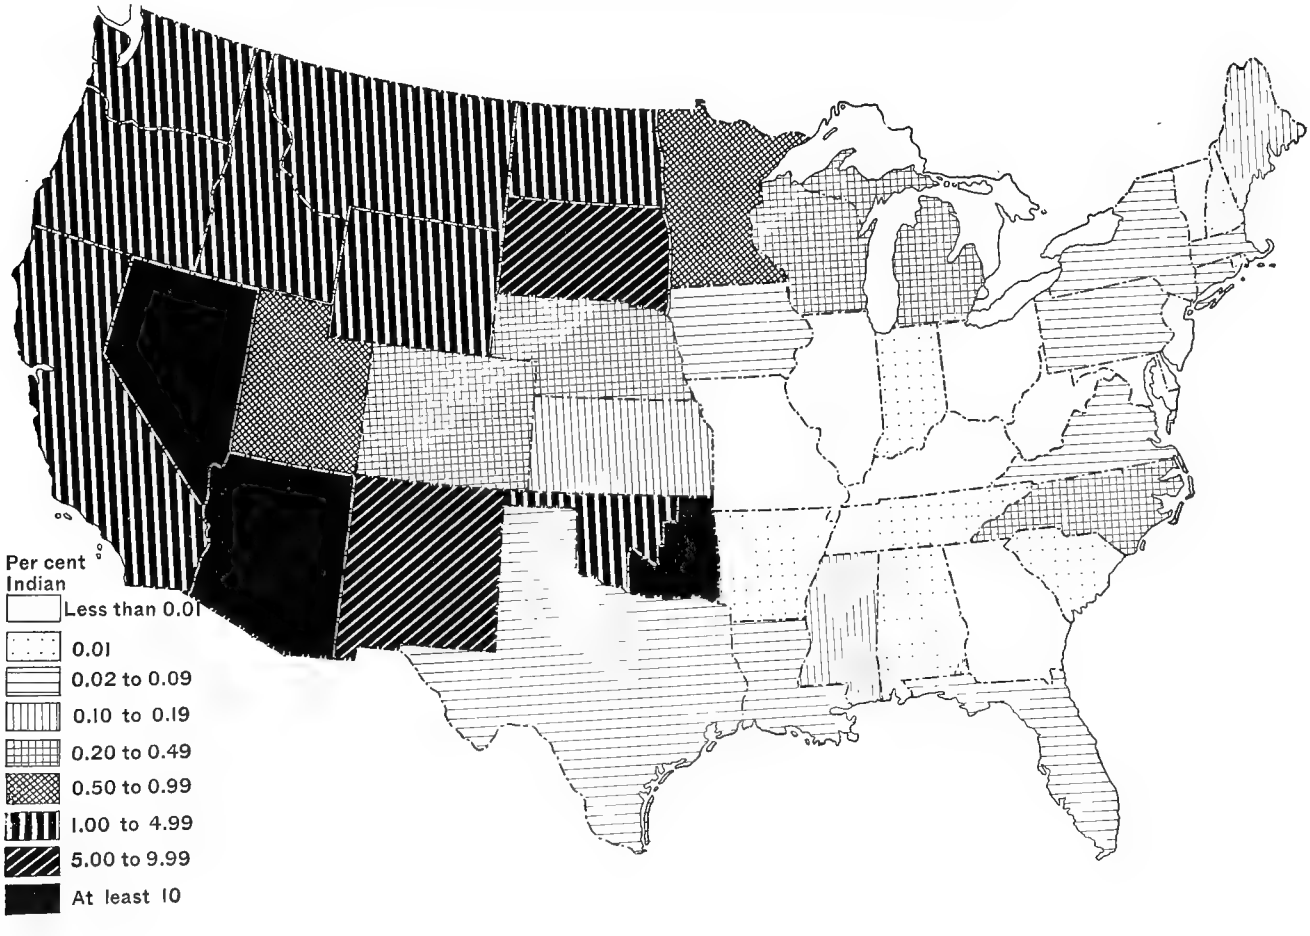

Table III shows that at each census the number of Indians, like that of Mongolians, was greatest in the Western division. The Indians, however, are far more numerous in the Central than in the Atlantic divisions.

Map 24 shows that the per cent Indian in total population is appreciably great mainly in the states and territories west of the Mississippi river and that Arizona, Indian Territory, and Nevada are the only divisions with at least 10 per cent of Indians in their population.

The Indians reported by the census of 1890 as living in continental United States were 248,253, those reported in 1900 were 237,196, a decrease of 4.5 per cent, while the total population increased 20.7 per cent. If North Carolina be omitted,[1] the decrease of Indians elsewhere is 6.2 per cent. It is probable that the intermixture of the Indian with the white and negro races is increasing and that the proportion of persons of mixed Indian blood, whose Indian features or characteristics are not so marked as to render their race affinities obvious to the average enumerator, is also increasing. If so, the decrease of enumerated Indians may be due either to the fact that the amount of Indian blood in the country is decreasing, or to the fact that it is becoming more attenuated and less recognizable, or to both combined.

The Indians, unlike the Mongolians, are much less numerous in cities having at least 25,000 inhabitants than in smaller cities or country districts. This appears clearly from the following table:

TABLE IV.—*Total population, Indian population, and proportion of Indians, in cities having at least 25,000 inhabitants and in smaller cities or country districts, for main geographic divisions: 1900.*

DIVISION.	1900					
	Total population.		Indian population.		Indians in 100,000 population.	
	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.
Continental United States	19,718,312	56,276,263	845	236,351	4	420
North Atlantic	10,098,096	10,947,999	447	8,112	4	74
South Atlantic	1,302,528	9,140,952	40	6,545	3	72
North Central	6,097,884	20,235,120	204	57,162	3	282
South Central	1,186,025	12,891,022	17	68,147	1	529
Western	1,033,179	3,058,170	137	96,385	13	3,152

Mongolians. Of the 114,189 Mongolians in continental United States practically one-half (49.0 per cent) are in California. The other two Pacific coast states, Oregon and Washington, rank second and third in the order of number of Mongolians, the three states together having more than two-thirds (68.3 per cent) of the Mongolian population of continental United States. But when attention is given not to the absolute numbers, but to the per cent that the Mongolian population makes of the entire number, it appears that Nevada has a larger proportion than either Oregon or Washington and as large a proportion as California. This is due in great measure to the fact that San Francisco, the port through which most of the Chinese have entered the United States and dispersed over the country, is nearer to the settled part of Nevada than it is to the settled part of Oregon or Washington. The same circumstance may account for the fact that the per cent Mongolian in Oregon is nearly double that in Washington.

The map showing the distribution of Mongolians by states and territories, when taken in connection with the table, indicates that this class of the population is substantially confined to the Western division, every state in that division having a larger proportion of Mongolians in its population than any state of the Atlantic or Central divisions, except the District of Columbia. Arranging the divisions of the United States in which the Mongolians constitute at least 1 per cent of the total population in order, they are as follows:

STATE OR TERRITORY.	Per cent Mongolian.
Hawaii	56.4
Alaska	5.3
California	3.8
Nevada	3.8
Oregon	3.1
Washington	1.8
Idaho	1.7
Montana	1.7
Arizona	1.4

The preceding figures show that Mongolians constitute an important element of the population only in those parts of the country which lie in, front upon, or open toward the Pacific ocean.

The Mongolian population of Alaska increased between 1890 and 1900 from 2,288 to 3,395, that of Hawaii from 29,362 to 86,878. The Mongolian population of continental United States was 109,527 in 1890, and 114,189 in 1900, an increase of 4.3 per cent, or at a rate much less than that of the whole population. In consequence the Mongolian population of continental United States was 0.17 per cent of the population in 1890 and 0.15 per cent in 1900.

[1] Because of the fact already mentioned that the Croatans of that state were classed as white in 1890 and as Indian in 1900.

MAP 25.—PER CENT MONGOLIAN IN TOTAL POPULATION: 1900.

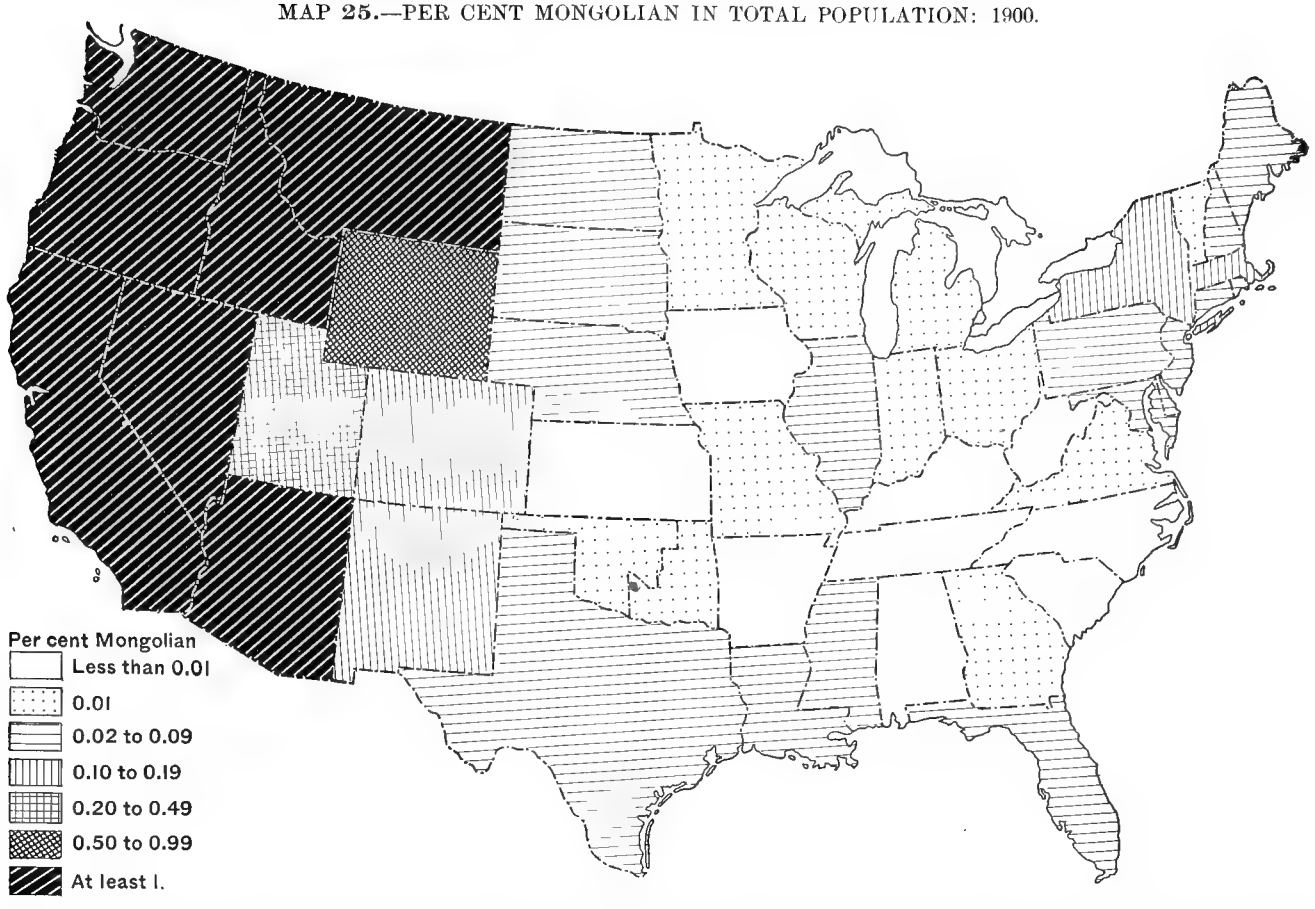

TABLE V.—*Number and per cent distribution of Mongolian population of continental United States, by division of residence: 1900 and 1890.*

DIVISION.	MONGOLIAN POPULATION.		PER CENT OF MONGOLIAN POPULATION OF CONTINENTAL UNITED STATES LIVING IN SPECIFIED DIVISION.	
	1900	1890[1]	1900	1890[1]
Continental United States	114,189	109,527	100.0	100.0
North Atlantic division	15,228	6,424	13.3	5.9
New England	4,292	1,533	3.7	1.4
Southern North Atlantic	10,936	4,891	9.6	4.5
South Atlantic division	1,820	724	1.6	0.7
Northern South Atlantic	1,376	422	1.2	0.4
Southern South Atlantic	444	302	0.4	0.3
North Central division	4,017	2,468	3.5	2.2
Eastern North Central	2,659	1,355	2.3	1.2
Western North Central	1,358	1,113	1.2	1.0
South Central division	2,019	1,508	1.8	1.4
Eastern South Central	434	293	0.4	0.3
Western South Central	1,585	1,215	1.4	1.1
Western division	91,105	98,403	79.8	89.8
Rocky Mountain	8,788	6,782	7.7	6.2
Basin and Plateau	4,269	4,817	3.7	4.4
Pacific	78,048	86,804	68.4	79.2

[1] Includes population of Indian Territory and Indian reservations.

The per cents in the preceding table show that the Mongolian population of continental United States has been dispersing over the country in the last ten years. In 1890 nine-tenths were residents of the Western division, and in 1900 only eight-tenths resided there, while the proportion in the North Atlantic division had sharply increased and that in each of the other divisions had increased somewhat. Yet three-fourths of the relative loss in the Western division was offset by gains in the North Atlantic division. As the latter is the division with the largest urban population, and as the Mongolians are believed to prefer city life and occupations, the two facts may be related. To test it, the proportion of Mongolians to total population in cities having at least 25,000 inhabitants and in smaller cities or country districts has been ascertained for 1900 and the results are shown in Table VI.

The figures in the table show that in every main geographic division the proportion of Mongolians in the total population is much greater in cities having at least 25,000 inhabitants than in smaller cities or country districts. In the Western division, which contains nearly four-fifths of the total Mongolian population of continental United States, they are about twice as numerous in the city as in the country population. The contrast is more marked in the other divisions. In the North Atlantic division, the next in importance, the proportion of Mongolians is more than four and one-half times as great in the city as in the country population.

TABLE VI.—*Total population, Mongolian population, and proportion of Mongolians, in cities having at least 25,000 inhabitants and in smaller cities or country districts, for main geographic divisions: 1900.*

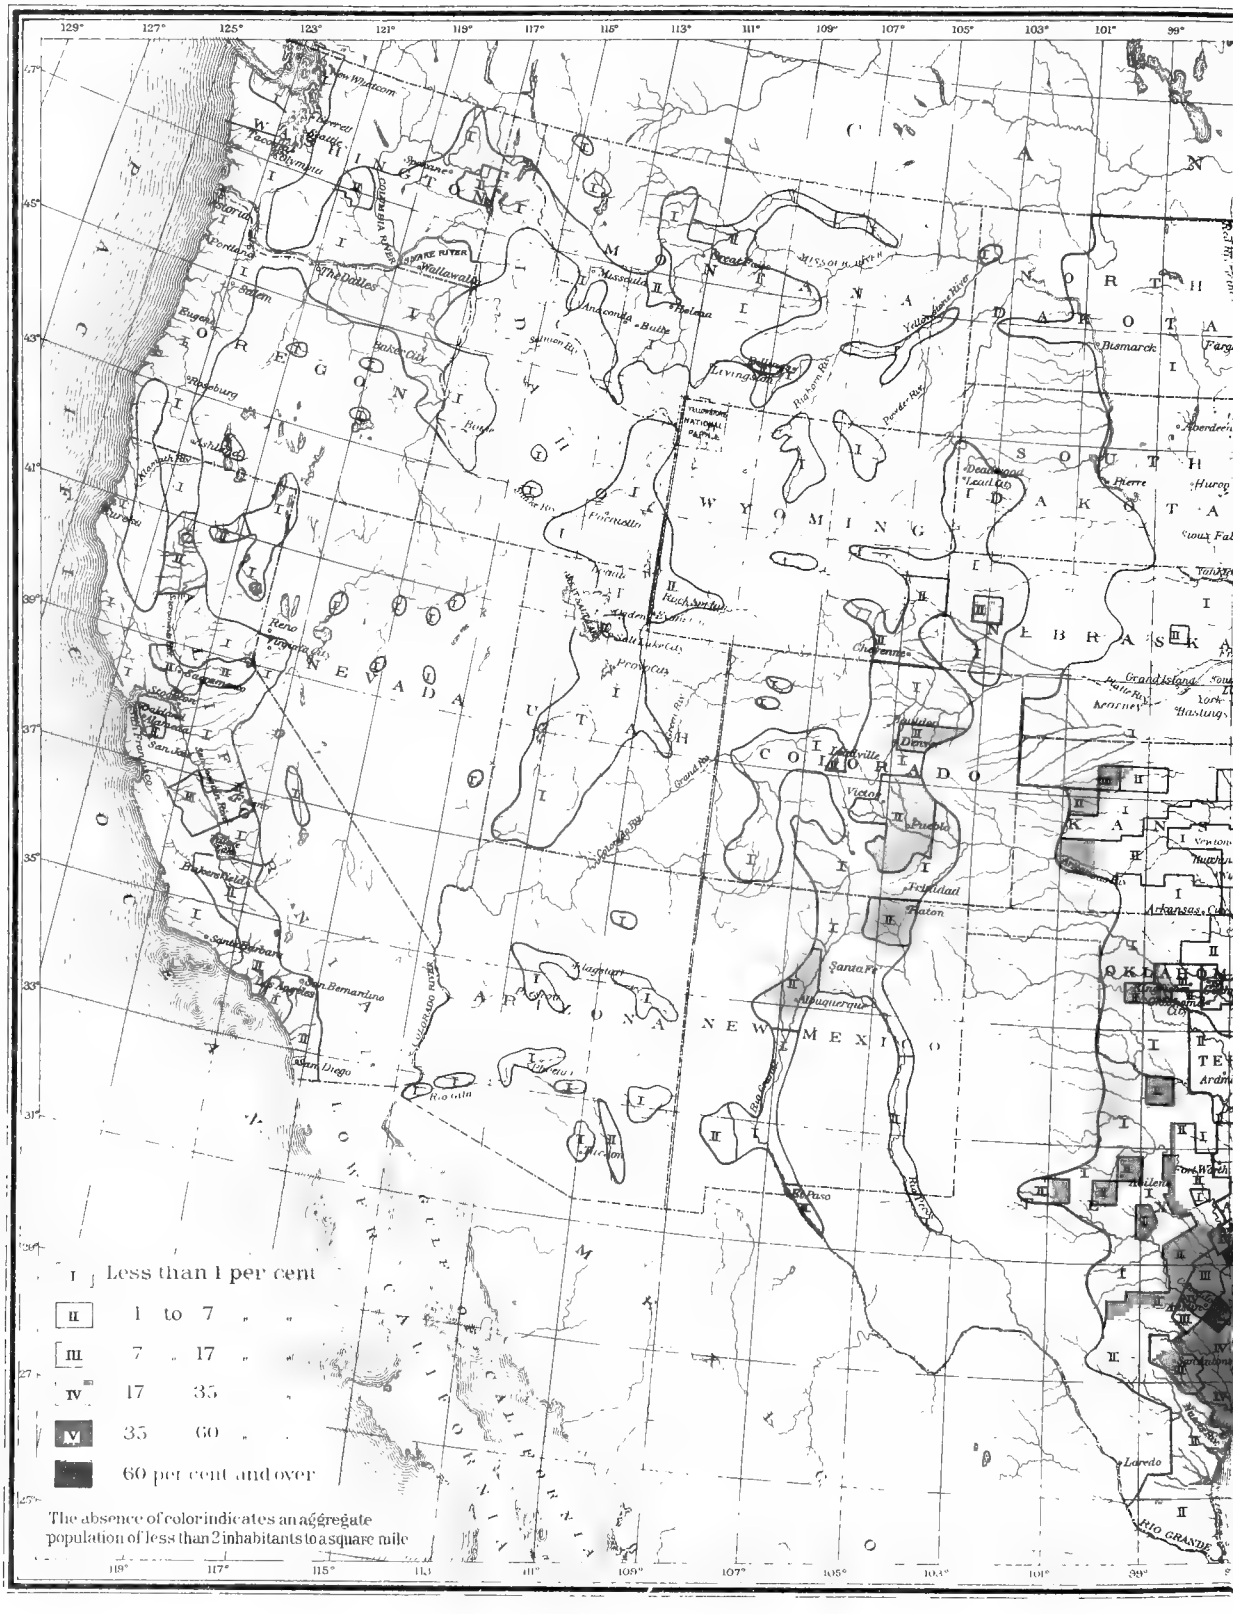
DIVISION.	1900					
	Total population.		Mongolian population.		Mongolians in 100,000 population.	
	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.
Continental United States	19,718,312	56,276,263	51,850	62,339	263	111
North Atlantic	10,098,696	10,947,999	12,271	2,957	122	27
South Atlantic	1,302,528	9,140,952	1,289	531	99	6
North Central	6,097,884	20,235,120	2,367	1,650	39	8
South Central	1,186,025	12,894,022	796	1,223	67	9
Western	1,033,179	3,058,170	35,127	55,978	3,400	1,830

Chinese and Japanese.—The Mongolian population of continental United States consists of two elements, the Chinese and the Japanese, the former decreasing and the latter increasing in numbers, as appears from the following figures:

TABLE VII.—*Number and per cent of Chinese and Japanese in Mongolian population, for continental United States: 1900 and 1890.*

	NUMBER.		PER CENT.	
	1900	1890	1900	1890
Mongolians	114,189	109,527	100.0	100.0
Chinese	89,863	107,488	78.7	98.1
Japanese	24,326	2,039	21.3	1.9

In 1890 only about one-fiftieth, in 1900 over one-fifth, of the Mongolian population consisted of Japanese. The decrease of Chinese in continental United States is due to restrictive immigration laws. The distribution of these two elements over the five main geographic divisions presents a striking contrast, as is shown in Table VIII.



In 1890 nine-tenths of the Chinese in this country were in the Western states; in 1900 only three-fourths were there, the others having gone mainly to the North Atlantic states. The movement of the Japanese is in the opposite direction. In 1890 only about three-fourths of them were in the Western states; in 1900 over nineteen-twentieths were there, and this not because of a decrease in the total number in the rest of the country, but because of the great increase in the Western division. The Japanese in the Atlantic and Central divisions taken together increased from 480 in 1890 to 950 in 1900; those in the Western division increased from 1,559 to 23,376.

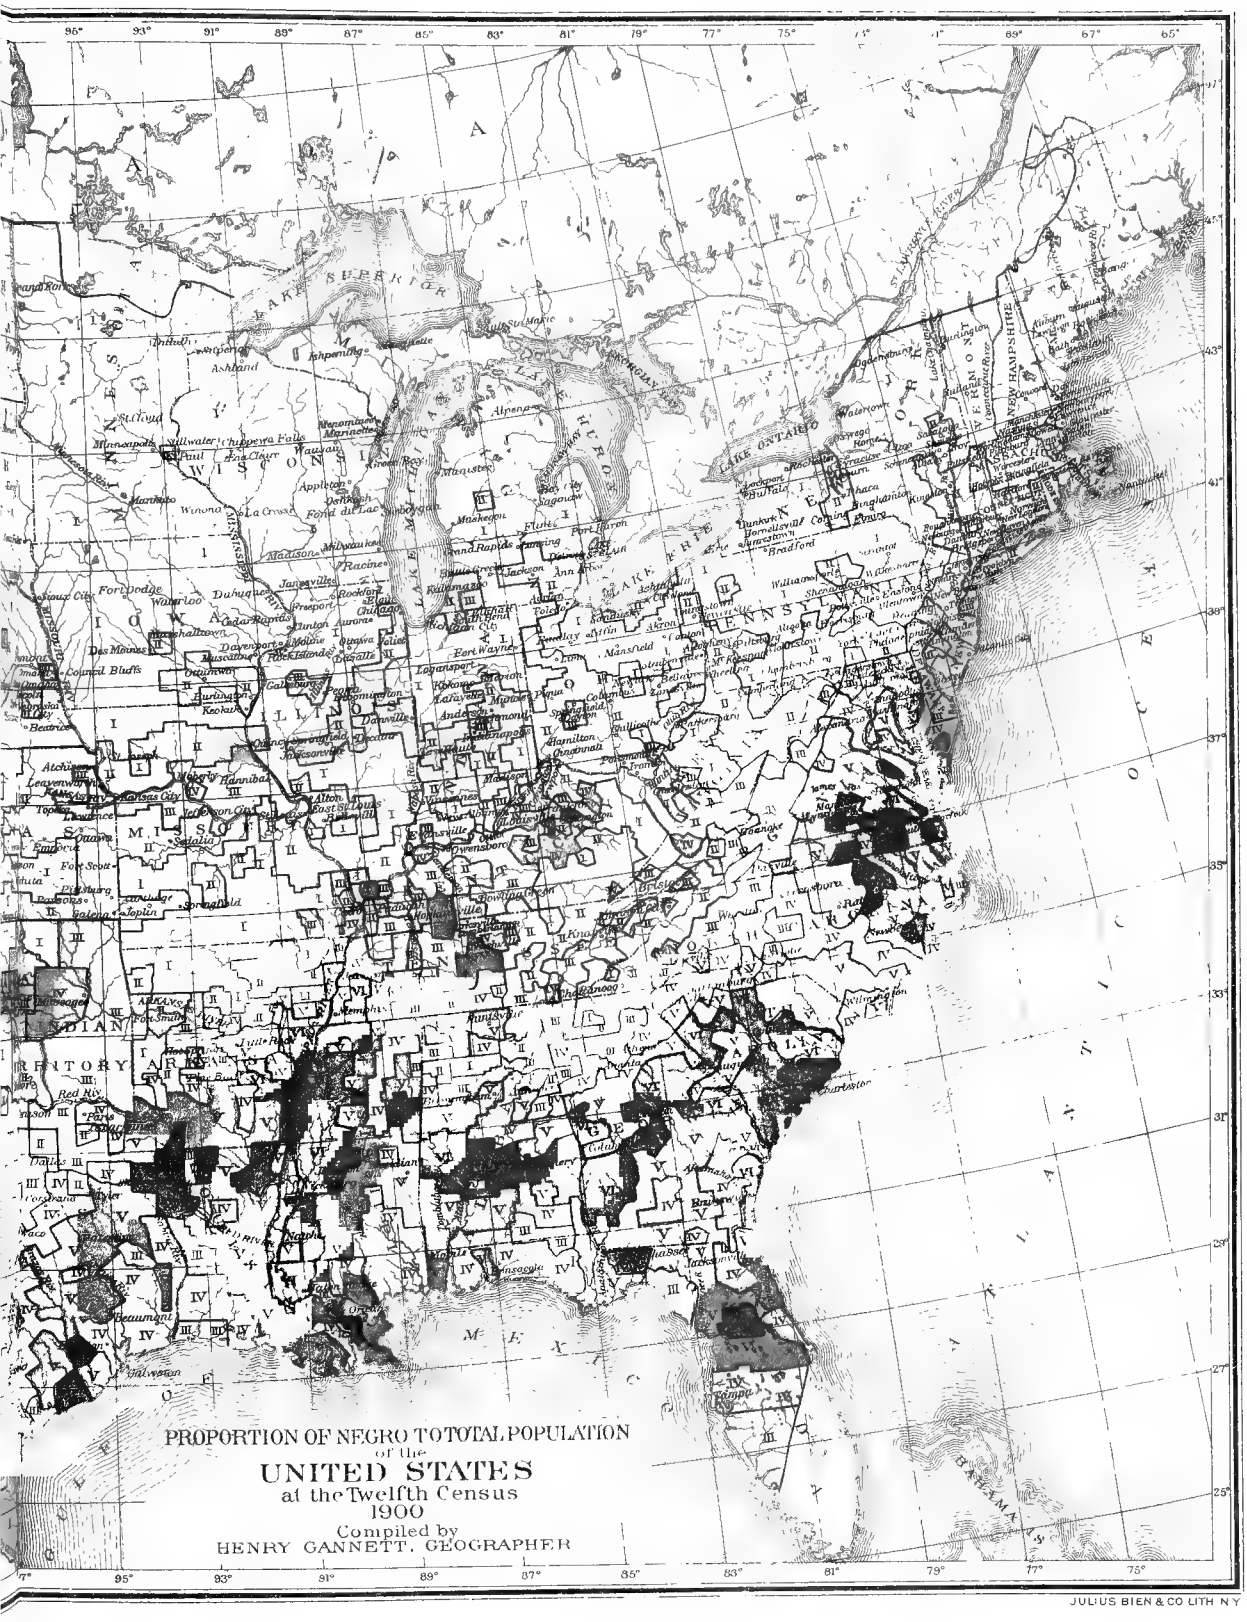


TABLE VIII.—*Number and per cent distribution of Chinese and Japanese population of continental United States, by division of residence: 1900 and 1890.*

DIVISION.	CHINESE POPULATION.		JAPANESE POPULATION.		PER CENT OF POPULATION OF CONTINENTAL UNITED STATES LIVING IN SPECIFIED DIVISION			
					Chinese.		Japanese.	
	1900	1890	1900	1890	1900	1890	1900	1890
Continental United States	89,863	107,488	24,326	2,039	100.0	100.0	100.0	100.0
North Atlantic	14,693	6,177	535	247	16.3	5.8	2.2	12.1
South Atlantic	1,791	669	29	55	2.0	0.6	0.1	2.7
North Central	3,668	2,351	349	117	4.1	2.2	1.4	5.7
South Central	1,982	1,447	37	61	2.2	1.3	0.2	3.0
Western	67,729	96,844	23,376	1,559	75.4	90.1	96.1	76.5

Of the entire population of California, 36.5 per cent live in cities having at least 25,000 inhabitants. Of the Chinese population 39.5 per cent live in such cities and of the Japanese population only 24.2 per cent. This indicates that the Japanese population, in California at least, notwithstanding its recent arrival, is distributed over the state not only more evenly than the Chinese, but more evenly than the entire population.

Bureau of the Census
S.N.D North, Director

JULIUS BIEN & CO. LITH. N.Y.

NEGROES.

SUMMARY OF RESULTS.

The census of the negroes in 1900 was probably less accurate than that of the whites, the unavoidable omissions being somewhat more numerous than the undetected duplications, but it is believed to be not more than 2 per cent below the truth and at least as accurate as any previous census of the negroes.

The censuses of mulattoes, as distinguished from full-blooded negroes, taken in 1850, 1860, 1870, and 1890, though subject to a far greater and wholly indeterminate probable error, have shown a general agreement of results.

They indicate that between 11 and 16 per cent of the negro population have, or are believed by the enumerators to have, some degree of white blood.

The proportion of mulattoes to all negroes is lowest as a rule where the proportion of whites in the total population is lowest, and highest, as a rule, where the proportion of whites in the total population is highest.

The proportion of mulattoes to all negroes is usually higher in cities of the great cotton growing states than it is in the districts outside of the cities.

The number of negroes in the United States, including the entire area covered by the Twelfth Census (continental United States, Alaska, and Hawaii) and Porto Rico, is nine and one-fifth million (9,204,531), perhaps a larger number than is found in any other country outside of Africa.

Nearly nine-tenths (89.7 per cent) of the negroes living in continental United States are found in the Southern (South Atlantic and South Central) states, and three-tenths (31.4 per cent) in Georgia, Mississippi, and Alabama.

The largest numbers of negroes living in compact masses are found in certain urban counties, several of which lie outside the great cotton growing states. The four each having over 75,000 negroes are: District of Columbia, coextensive with Washington; Shelby county, Tenn., containing Memphis; Baltimore city, Md.; and Orleans parish, La., coextensive with New Orleans.

The "black belt," that is, the counties in which the negroes are at least half the total population, lies mainly south and east of the northern and western boundaries of the Austroriparian zone of plant and animal life as defined by the Department of Agriculture, and this was more nearly true in 1900 than in 1860.

The district in which the proportion of negroes is greatest lies in the Mississippi alluvial region along both banks of the lower Mississippi, where five-eighths of the population is negro, the maximum being in Issaquena county, Miss., with more than 15 negroes to each white person.

There are 55 counties and only 1 city in continental United States in which at least 75 per cent of the population is negro.

Where the proportion of negroes in the population is very high it is usually higher in the country districts than in the cities; where that proportion is very low it is usually lower in the country districts.

The center of the negro population is in Dekalb county, northeastern Alabama, about 4 miles from the western boundary of Georgia, and 33 miles south of the southern boundary of Tennessee.

The center of the negro population has moved since 1790 from a point in Dinwiddie county, Va. (27 miles southwest of Petersburg), 476 miles southwest to the above-mentioned point.

The center of the negro population of the Southern states is farther south and west than the center of the entire negro population, and it is also much farther south than and a little east of the center of white population of the Southern states.

There is some evidence of a slight tendency to a local separation between the two races in the South since 1890, the center of population for southern negroes being 79 miles from that for southern whites in 1890 and 94 miles in 1900.

More than three-fourths (77.3 per cent) of the negroes live in the country—that is, outside of cities[1] having at least 2,500 inhabitants—this per cent being far greater than that of the whites (57.3 per cent).

But when the figures are confined to the South there is no important difference traceable between the two races.

Outside of the South—that is, in the North and West—

[1] Including all incorporated places, and in New England all towns not containing an incorporated place.

seven-tenths (70.2 per cent) of the negroes and only five-tenths (50.6 per cent) of the whites live in cities as above defined.

Negroes constitute about one-fifteenth (6.6 per cent) of the city population and about one-seventh (15 per cent) of the country population of continental United States.

In the South negroes are about one-third of the population, both in cities (30.9 per cent) and in country districts (32.6 per cent).

In the North and West they are about one-fortieth (2.4 per cent) of the city population and one-ninetieth (1.1 per cent) of the country population.

Owing to the admitted errors of the census of 1870, especially among the negroes, the best method of measuring increase is probably by twenty-year periods, 1800 to 1820, 1820 to 1840, 1840 to 1860, 1860 to 1880, and 1880 to 1900.

The rate of increase of negroes as thus measured declined steadily through the nineteenth century; that of whites was highest between 1840 and 1860.

In the Southern states the increase of the negroes in each decade between 1800 and 1840 was more rapid than that of the whites; since 1840 it has been less rapid.

Between 1860 and 1900 southern negroes increased 93.4 per cent and southern whites 134.9 per cent.

In the country districts of the South, excluding the population of the 242 cities which had at least 2,500 inhabitants both in 1890 and in 1900, the negroes increased, 1890 to 1900, 16.4 per cent; in the 242 southern cities as a whole they increased 21.7 per cent. Their increase in the country districts was about two-thirds as rapid as that of the whites in the same area; their increase in southern cities was nearly five-sixths as fast as that of the whites in the same cities.

In the largest southern cities, that is, the 5 having at least 100,000 inhabitants in 1900, the negro population increased 25.8 per cent, 1890 to 1900; the white population of the same cities increased only 20.8 per cent. This is the only group of southern cities in which the rate of increase of negro population exceeded that of the whites. In the 38 cities of this class in continental United States the per cent of increase, 1890 to 1900, was 38 for negroes and 32.7 for whites.

The negroes, unlike the Indians and the native whites, have a slight excess of females.

In the country districts as a whole, negro males outnumber negro females slightly (10 per thousand); in the cities, females outnumber males decidedly (66 per thousand).

A difference of the same sort but greater in amount exists between the urban and the rural negro population of the Southern states, where in the country districts the males outnumber the females 8 per thousand, and in the cities the females outnumber the males 88 per thousand.

This dissociation of the sexes between city and country is far more marked among negroes than among whites, and has increased since 1890.

The age of negroes is reported with much inaccuracy, the proportion of errors increasing with age.

These inaccuracies are greater in the South than in the North, and were less marked in all parts of the country in 1900 than in 1890.

The median age of negroes is 19.4 years, that is, half the negroes in the United States are below that age.

The median age is 4 years below that of the whites (23.4 years), a difference closely connected with the high birth rate and high death rate of the negroes.

The median age of negroes, Indians, and Mongolians, or non-Caucasians, in 1880 was 18 years; in 1900 it was 19.7 years, the increase of 1.7 years since 1880 being probably connected with a decline both in the birth rate and in the death rate.

Among negroes at least 10 years of age 44.5 per cent are illiterate, that is, unable to write, the great majority of them being also unable to read. The per cent illiterate has decreased rapidly since 1890 when it was 57.1 per cent.

Illiteracy among negroes is about seven times as common as among whites, and this ratio between the races has not altered materially in the last ten years.

Illiteracy among southern negroes is more than four times that among southern whites.

If the per cent of illiterates should fall in each succeeding ten years by as great an amount as it did between 1890 and 1900, an improbable assumption, it would become zero about 1940.

Illiteracy is much more prevalent in country districts than in cities. Thus in the Southern states nearly one-half (49.8 per cent) of the negroes at least 10 years of age living outside cities having at least 25,000 inhabitants, are returned as illiterate. But in the cities less than one-third (31.5 per cent) of the negroes are so returned.

With negroes, as with whites, the female is the more illiterate sex.

The per cent of illiteracy is highest for the age period 65 years and over, and lower for each earlier age period, the minimum being at 10 to 14 years; these differences indicating and roughly measuring the spread of school facilities in recent years. The lower per cent of illiteracy among negroes born since the Civil War is clearly evident from the figures for illiteracy by age periods.

About six-tenths (60.5 per cent) of the negroes of all ages are single, between three-tenths and one-third (32.5 per cent) are married, and nearly one-fifteenth (6.8 per cent) are widowed or divorced.

About one-third (34.5 per cent) of the adult negroes (above 15 years of age) are single, more than one-half (53.9 per cent) are married, and about one-ninth (11.2 per cent) are widowed or divorced.

The proportion of single and of married in the adult negro population has slightly declined, that of widowed and divorced slightly increased since 1890; these changes differing in one particular—the decline in the proportion of married—from those which occurred during the same period among white adults, both in the entire country and in the Southern states.

There was a decided increase between 1890 and 1900 in the proportion of married among young negroes. This included male negroes 15 to 24 years of age and female negroes 15 to 19. The proportion married at later ages declined for both sexes. This increase of early marriages was yet more marked among southern whites of both sexes and was probably due to the great prosperity of the country just before 1900.

There are nearly four million (3,992,337) negroes in continental United States engaged in gainful occupations.

These persons, who may be called breadwinners, constitute 45.2 per cent of the total negro population, while for the total white population the per cent is 37.3, and for southern whites 34.2.

Negro breadwinners constitute 62.2 per cent of all negroes at least 10 years of age. For whites the corresponding per cent is 48.6, and for southern whites 46.9.

The relatively high per cent for negroes is closely connected with the marked prevalence of female labor in that race. Among females at least 10 years of age, 40.7 per cent of the negroes and only 16 per cent of the whites and 11.8 per cent of the southern whites report money getting occupations, a difference which accounts for about three-fourths of the difference in the proportion of breadwinners in the two races.

That part of the difference between negroes and whites in the proportion of breadwinners to population at least 10 years of age, which is not accounted for by the much greater prevalence of gainful occupations among negro women, finds its explanation in the fact that negro boys and young men, and also negro men over 55 years of age, are more generally engaged in breadwinning than white boys and men of corresponding ages.

These differences might be due to the greater prevalence of agricultural pursuits among negroes, that class of occupations furnishing an unusually good field for employing boys and old men. But indirect evidence indicates that among negroes engaged in agriculture, young men, old men, and women help in breadwinning much more generally than they do among whites engaged in the same class of work.

More than one-fourth (26 per cent) of the negro wives and two-thirds (67 per cent) of negro widows report a gainful occupation and the proportions have increased since 1890 from 22.7 per cent for wives and 62.6 per cent for widows.

There are 27 occupations in which at least 10,000 negroes were reported as engaged in 1900. These occupations gave employment to 3,807,008 negroes or more than 95 per cent of the total number of negro breadwinners.

The ill-defined and fluctuating character of the division lines between farmers, planters, and overseers, agricultural laborers, and laborers (not specified), makes it difficult to interpret the figures regarding persons engaged in agriculture. The three classes together include two-thirds of all negro breadwinners.

In the following 13 of these 27 leading occupations the proportion of negroes among all breadwinners in the occupation in continental United States was greater in 1900 than in 1890: Servants and waiters, draymen, hackmen, teamsters, etc., miners and quarrymen, saw and planing mill employees, porters and helpers (in stores, etc.), teachers, nurses and midwives, clergymen, hostlers, masons (brick and stone), dressmakers, iron and steel workers, and engineers and firemen (not locomotive).

In the following 10 of these 27 leading occupations the proportion of negroes among all breadwinners in the occupation in continental United States was less in 1900 than in 1890: Launderers and laundresses, steam railroad employees, carpenters and joiners, barbers and hairdressers, tobacco and cigar factory operatives, seamstresses, janitors and sextons, housekeepers and stewards, fishermen and oystermen, and blacksmiths.

When the figures are confined to the South, there are found to be 7 leading occupations, namely, servants and waiters, miners and quarrymen, saw and planing mill employees, teachers, nurses and midwives, clergymen, and iron and steel workers, in which the per cent of negroes among all persons in the occupation was larger in 1900 than in 1890; and 9 leading occupations, namely, launderers and laundresses, draymen, hackmen, teamsters, etc., steam railroad employees, carpenters and joiners, barbers and hairdressers, tobacco and cigar factory operatives, housekeepers and stewards, fishermen and oystermen, and engineers and firemen (not locomotive), in which the per cent of negroes among all persons in the occupation was smaller in 1900 than in 1890. In 8 occupations, namely, porters and helpers (in stores, etc.), turpentine farmers and laborers, hostlers, masons (brick and stone), dressmakers, seamstresses, janitors and sextons, and blacksmiths, no figures for the Southern states were separately reported in 1890.

The Bureau of the Census has no information regarding births or marriages.

It has no trustworthy information regarding deaths in the entire country, but finds and accepts as trustworthy the records of death in a registration area containing 13.4 per cent of the negroes and 41.2 per cent of the whites of continental United States.

The death rate of negroes in the registration area in 1900 was 30.2; that of whites in the same area was 17.3.

The death rate of negroes alone in the registration area in 1890 is unknown; that of negroes, Indians, and Mongolians or non-Caucasians in the registration area

in 1890 was 29.9, that of the same class in the slightly different registration area in 1900 was 29.6, indicating a slight decrease in the death rate of negroes during the decade, 1890 to 1900.

The death rate in 1900 in the registration area was 31.4 for negro males and 27.8 for negro females.

The negro, Indian, and Mongolian population of the registration area has a larger proportion of persons between 5 and 64 years of age, approximately the age periods when the death rate is below the average for all ages, and a larger proportion of females than the negro population of the entire country, both differences tending to lower the death rate of negroes in the registration area below what it would otherwise be.

If these known and measurable differences between the negroes, Indians, and Mongolians of the registration area and the negroes of the entire country be allowed for, and if in other respects the ascertained conditions of the former group be assumed to hold good for the latter, then the death rate of negroes in continental United States in 1900 appears to be 34.2.

Of the negro population of the registration area 93.2 per cent are living in cities, and a city death rate is usually higher than a country death rate. On the other hand, the evidence gathered by the Bureau of the Census indicates that not quite all deaths in the registration area are recorded. This influence would make the true death rate of negroes in the registration area higher than the observed death rate. Of these two influences acting in opposite directions the former is believed to be the stronger, but not enough to deprive the preceding estimate of value.

The number of negro, Indian, and Mongolian children under 5 years of age to each 1,000 women 15 to 44 years of age was 759 in 1880 and 585 in 1900, showing a decrease of 174 in twenty years. The number in 1880 was 173 greater, and in 1900, 77 greater than the corresponding number for the whites.

The Bureau of the Census has no information regarding negro paupers, insane, or prisoners more recent than that gathered in 1890. As census inquiries on these topics are now in progress, no information regarding them has been incorporated in this section.

NATURE AND ACCURACY OF RETURNS.

Definition.—For census purposes a negro is a person who is so classed in the community in which he resides. The enumerator is supposed to know this fact or to ascertain it by observation or inquiry. No instructions regarding the basis of classification have been thought necessary, and no effort is made to apply what is probably the only alternative definition of negro open to consideration, that employed in many state statutes prohibiting miscegenation, "a person with one-eighth or more of negro blood." Local opinion probably classes as a negro any one known or believed to have any trace of negro blood, even if it be less than one-eighth, and the definition of the census, if accurately followed, would probably class more persons as negroes than the prevalent definition of the statutes.

In censuses prior to 1890 the word colored was generally used as synonymous with negro as above defined; in the census of 1890, and to some extent in that of 1900, the word colored was given a wider significance, including all persons not belonging to the Caucasian or white race, and embracing, therefore, not only the negroes, but also the Indians, the Chinese, and the Japanese. In the usage of the West India Islands the word colored means persons of mixed white and black blood. That the dislike and avoidance of the word negro among members of the African race is disappearing seems to be implied by current usage as indicated in the title of such books as Mr. W. E. B. Du Bois's "The Philadelphia Negro," and Mr. Booker T. Washington's "The Future of the American Negro." As this opposition was the only known objection to the accurate term, the change of usage on the part of the census seems to be justified.

At the censuses of 1850, 1860, 1870, 1880, and 1890 efforts were made to secure returns of mulattoes, and at all these censuses, except that of 1880, the results were published. The instructions to the enumerators on this point were as follows:[1]

1850. For filling the schedule for free inhabitants:

> In all cases where the person is white, leave the space blank; in all cases where the person is black, insert the letter B; if mulatto, insert M. It is very desirable that these particulars be carefully regarded.

For filling the schedule for slave inhabitants:

> Insert in all cases, when the slave is black, the letter B; when he or she is a mulatto, insert M. The color of all slaves should be noted.

1860. No instructions known to have been issued.

1870:

> Be particularly careful in reporting the class *Mulatto.* The word is here generic, and includes quadroons, octoroons, and all persons having any perceptible trace of African blood. Important scientific results depend upon the correct determination of this class.

1880. Same instructions as 1870.

1890:

> Write *white, black, mulatto, quadroon, octoroon, Chinese, Japanese,* or *Indian,* according to the color or race of the person enumerated. Be particularly careful to distinguish between blacks, mulattoes, quadroons, and octoroons. The word "black" should be used to describe those persons who have three-fourths or more black blood; "mulatto," those persons who have three-eighths to five-eighths black blood; "quadroon," those persons who have one-fourth black blood; and "octoroon," those persons who have one-eighth or any trace of black blood.

The accuracy of the census figures on mulattoes in 1850, 1860, 1870, and 1890 will be considered later.

The census recognizes in the population of continental United States four races which in the order of numer-

[1] History and Growth of the United States Census, C. D. Wright and W. C. Hunt; pages 152, 153, 157, 171, and 187.

ical importance are white, negro, Indian, and Mongolian. The last two combined constitute less than one two-hundredth of the population of continental United States, and in the Southern states where the negroes are most numerous the Indians and Mongolians are less than 1 per cent of the entire non-Caucasian population. To secure simplicity the following analysis will compare the results for whites and negroes, disregarding the other races. In some cases where the figures for negroes alone are not obtainable the figures for the three non-Caucasian races combined will be used. But this comparison will be made only when the slight error thus introduced is thought so small as not to affect the inferences drawn.

Accuracy of returns.—A census taken with reasonable care is admitted to be a more accurate determination of the population than any other source of information. For this reason it is almost impossible to ascertain how closely its results approximate the truth. My opinion is that in 1880, 1890, and 1900, the figures for total population were within half of 1 per cent of the truth.[1] With reference to the negro population, however, two considerations suggest that the probable error of the returns can not be deemed so small. Persons living outside of homes, so that the enumerators can not readily find them or gain information about them, constitute a larger proportion of the negro population than of the total population, and among such a class the probable error would be decidedly greater than the limit above named. Furthermore, the enumerator in classifying the families as negro or white must make some errors. When he classifies by observation alone (and it must be borne in mind that he usually sees personally only a small proportion, perhaps not more than one-fifth, of the persons about whom he reports), he must judge some families to be negro that are really white and some to be white that are really negro. It seems likely that errors of the latter sort would be more common than those of the former. If conscious and deliberate efforts to pad the returns, either for political purposes or in order to increase the pay of enumerators, were an important factor in the census, this might work in the opposite direction, but there is no reason to believe that this cause of error has exerted an appreciable influence on the figures. Thus the only important causes of error affecting the figures for negroes seem to tend in the direction of an understatement of the true population.

These reasons for believing that omissions in the enumeration of negroes are relatively more frequent than in the enumeration of whites derive some confirmation from the following facts: In 2 counties of Maryland and 11 of the 19 enumeration districts in a third county, a careful reenumeration was had soon after the original count, in the effort to gather evidence upon which indictments of the enumerators for false and fraudulent returns might be based. The work was done under the direct and personal superintendence of officials trained in the Office, and there is no reason to doubt the accuracy of their conclusions. The reenumeration applied to a reported population of 62,940, and showed that among these, 1,554 or 2.5 per cent had been omitted by the enumerators. It included 28,139 negroes, and of these, 1,049 or 3.7 per cent had been omitted. It included 34,801 whites, and of these, 505 or 1.5 per cent had been omitted. The Office sees no reason for extending these per cents of omission to the country as a whole, but the fact that the per cent of negroes omitted was two and one-half times that of the whites may fairly be taken as some indication of the probable ratio of omissions between the two races in other parts of the country. It is my personal belief that the enumeration of negroes in 1900 was within 2 per cent of the truth; that omissions were more frequent than duplicate entries, so that the published total is a slight understatement of the truth; and that the margin of error at earlier censuses was somewhat larger.

Mulattoes.—While the probable error in the returns of the total negro population of the United States is not very great, the same can not be said of the returns of mulattoes and full-blooded negroes in 1850, 1860, and 1870, or of the returns of negroes, mulattoes, quadroons, and octoroons in 1890. The last inquiry was made under strict instructions from Congress, the census law providing "That the population schedule shall include an inquiry as to the number of negroes, mulattoes, quadroons, and octoroons." Regarding the results of this last inquiry, the Eleventh Census said: "These figures are of little value. Indeed, as an indication of the extent to which the races have mingled, they are misleading."[2] While no competent authority will claim that a census can obtain trustworthy information regarding the intermixture of the two races in the detail in which it was called for by the law of 1889, yet it is not certain that the answers to the simple question about each negro whether he is of pure or of mixed blood would be erroneous in so many cases as to deprive the resulting tables of all value. The only available test of the trustworthiness of the results reached in 1850, 1860, 1870, and 1890[3] would be the degree to which they corroborated and confirmed one another. In order to ascertain this fact the following percentages have been computed, showing the per cent of mulattoes among all negroes in 1850, 1860, 1870, and 1890 for every state and territory which had in the year

[1] Page 16.

[2] Eleventh Census, Population, Part I, page xciii.

[3] The returns made in 1880 were never tabulated and published. Those made in 1850 were not published in the census of 1850, but may be found in that of 1870. The returns for 1860 were republished with slight corrections in the census of 1870. The figures for 1850, 1860, and 1870 are found in Ninth Census, Population and Social Statistics, Table xxii, pages 607–615. The figures for 1890 are found in Eleventh Census, Population, Part I, Table 10, page 397.

specified at least 1,000 negroes. The figures from which these percentages have been computed will be found in Table LXXXIX of this section.

TABLE I.—*Per cent mulatto in total negro population: 1890, 1870, 1860, and 1850.*

STATE OR TERRITORY HAVING AT LEAST 1,000 NEGROES IN SPECIFIED YEAR.	PER CENT MULATTO IN TOTAL NEGRO POPULATION.

The figures warrant the belief that between one-ninth and one-sixth of the negro population of continental United States have been regarded by four groups of enumerators as bearing evidence of an admixture of white blood. The figures also indicate that this admixture was found by the enumerators to be most prevalent in sections where the proportion of negroes to whites is smallest, and least prevalent where the proportion of negroes to whites is largest. In order to facilitate the comparison of these results the 27 states and territories having at least 1,000 negroes in 1850 have been numbered in the order of increasing proportion of mulattoes to total negroes at each of the four censuses, 1850, 1860, 1870, and 1890. Thus the number 1 standing against the state of South Carolina in each of the four columns means that at each census the per cent of mulattoes to all negroes in South Carolina was less than in any other of the 27 states.

TABLE II.—*Rank of states and territories in order of increasing per cent mulatto in total negro population: 1890, 1870, 1860, and 1850.*

STATE OR TERRITORY HAVING AT LEAST 1,000 NEGROES IN 1850.	RANK IN ORDER OF INCREASING PER CENT MULATTO IN TOTAL NEGRO POPULATION.				Per cent negro in total population: 1890.
	1890	1870	1860	1850	
South Carolina	1	1	1	1	59.9
Georgia	2	2	3	2	46.7
Alabama	3	3	2	4	44.8
Mississippi	4	8	4	3	57.6
Florida	5	12	5	6	42.4
Delaware	6	6	11	5	16.9
Arkansas	7	7	7	12	27.4
Texas	8	10	10	11	21.8
North Carolina	9	5	6	8	34.7
New Jersey	10	11	9	15	3.3
Maryland	11	13	12	10	20.7
Louisiana	12	16	8	9	50.0
Tennessee	13	4	13	7	24.4
Virginia	14	14	15	14	38.4
Kentucky	15	19	17	13	14.4
New York	16	9	14	17	1.2
Missouri	17	15	16	16	5.6
Pennsylvania	18	18	21	21	2.1
Connecticut	19	22	18	19	1.6
District of Columbia	20	17	22	22	32.8
Rhode Island	21	20	19	18	2.1
Illinois	22	21	24	25	1.5
Indiana	23	24	25	26	2.1
Massachusetts	24	25	20	20	1.0
Ohio	25	23	23	27	2.4
Michigan	26	27	27	24	0.7
Maine	27	26	26	23	0.2

The table seems to show that as a rule the states with the largest proportion of negroes to total population have the smallest reported proportion of mulattoes to total negroes. To this general rule Louisiana is a noticeable exception, that being third in order of proportion of negroes to population, but ranging from eighth to sixteenth in the order of proportion of mulattoes to negroes. As one passes from the great cotton growing states between South Carolina and Texas toward the north, the proportion of mulattoes among the negroes as a rule increases. Doubtless the enumerators in the Northern states are less familiar with the racial characteristics of the negro and less able to judge of the question of intermixture of blood, but this hardly explains the difference. In order to eliminate the irregularities of the several states, the 9 minor geographic divisions

having at least 1,000 negroes in 1850 have been numbered in the order of increasing per cent of mulattoes to total negroes at each census.

TABLE III.—*Rank of minor divisions in order of increasing per cent mulatto in total negro population: 1890, 1870, 1860, and 1850.*

MINOR DIVISION HAVING AT LEAST 1,000 NEGROES IN 1850.	RANK IN ORDER OF INCREASING PER CENT MULATTO IN TOTAL NEGRO POPULATION.				Per cent negro in total population: 1890.
	1890	1870	1860	1850	
Southern South Atlantic	1	1	1	1	45.5
Eastern South Central	2	2	2	2	33.0
Western South Central	3	3	3	3	29.1
Northern South Atlantic	4	4	4	4	25.6
Southern North Atlantic	5	5	6	7	1.8
Western North Central	6	6	5	5	2.5
New England	7	7	7	8	0.9
Eastern North Central	8	8	9	9	1.6
Pacific	9	9	8	6	0.8

The general conclusion seems warranted that the proportion of mulattoes to total negroes was found by the enumerators to be high or low, according as the proportion of whites to negroes is high or low.

For two censuses, those of 1860 and 1850, the number of mulattoes is reported either by counties or separately for certain large cities. In order to ascertain whether the per cent of mulattoes to total negroes is greater in cities than elsewhere a computation has been made for certain cities or counties containing large cities in those years. The results are given in the following table:

TABLE IV.—*Per cent mulatto in total negro population: 1860 and 1850.*

[1] Includes West Virginia.

From the preceding table the following inferences may be drawn:

1. In cities lying within the great cotton growing belt the proportion of mulattoes in 1860 and 1850 was far greater than in the rest of the state. Such cities are New Orleans, Mobile, Savannah, and Charleston.

2. In cities lying outside the cotton growing area and within the border states the proportion of mulattoes was usually somewhat greater than in the rest of the state, but the difference was by no means so marked as it was in the cotton growing area. Illustrations of such cities are Richmond, Memphis, Louisville, Baltimore, and St. Louis.

The foregoing figures may be connected with the fact that before the Civil War the field hands in the cotton growing regions of the South associated with the whites much less intimately than the house servants, and that the latter class much more frequently than the former included a perceptible strain of white blood. Away from the cotton growing area the difference was less, but in the border states no small proportion of the slaves in the cities, many of them belonging to the class of household slaves, were infused with white blood.

As a general result of the analysis of the census figures on mulattoes, it appears that the censuses of 1850, 1860, and 1870 agree fairly among themselves, and furnish an index of some value regarding the intermixture of whites and blacks toward the close of the period of slavery. It can not be denied that the per cents of mulattoes to all negroes in some states differ so widely from census to census as to cast grave doubts upon the results. No one familiar with the facts would explain the apparent increase of mulattoes in Tennessee between 1850 and 1860 and the decrease between 1860 and 1870 as both real. I do not believe that the reported number of mulattoes can be deemed to be within 10 per cent of the true number, and see no means of judging with confidence whether the reported number exceeded or fell short of the truth. Yet even so, it is a step away from ignorance to have the observation of many thousand enumerators at four independent inquiries as evidence that in the United States between one-ninth and one-sixth of the negroes were of mixed blood, while in Cuba one-half and in Porto Rico five-sixths have been so classed by the census.[1]

DISTRIBUTION AND PROPORTION OF NEGROES.

Continental United States.—The total number of negroes reported by the Twelfth Census was 8,840,789.[2] To this number may be added the 363,742 persons of pure or mixed negro blood in Porto Rico,[3] and the 1,019 negroes in the Philippine Islands,[4] making a total of 9,205,550 negroes under American jurisdiction. Further attention will be confined to the 8,833,994 negroes of continental United States, thus excluding those of Porto Rico and the few in Alaska, Hawaii, the Philippine Islands, and the military and naval service.

[4] Census of the Philippine Islands, Vol. II, page 14.

While figures for continental United States will be presented, attention will be centered in many cases upon the South Atlantic and South Central states, in each of which, except West Virginia, Indian Territory, and Oklahoma, the negroes constitute at least 10 per cent of the population. This is true of no other state or territory in continental United States. The negroes were distributed through the main and minor divisions in 1900 as follows:

TABLE V.—*Number and per cent distribution of negro population of continental United States, by division of residence: 1900.*

DIVISION.	Negro population: 1900.	Per cent of negro population of continental United States living in specified division: 1900.
Continental United States	8,833,994	100.0
North Atlantic division	385,020	4.4
New England	59,099	0.7
Southern North Atlantic	325,921	3.7
South Atlantic division	3,729,017	42.2
Northern South Atlantic	1,056,684	12.0
Southern South Atlantic	2,672,333	30.2
North Central division	495,751	5.6
Eastern North Central	257,842	2.9
Western North Central	237,909	2.7
South Central division	4,193,952	47.5
Eastern South Central	2,499,886	28.3
Western South Central	1,694,066	19.2
Western division	30,254	0.3
Rocky Mountain	12,936	0.1
Basin and Plateau	2,654	(1)
Pacific	14,664	0.2

[1] Less than one-tenth of 1 per cent.

The preceding table shows that three-tenths of the negroes are found in the Southern South Atlantic states, nearly three-tenths more in the Eastern South Central, and nearly two-tenths in the Western South Central, these three regions having over three-fourths (77.7 per cent) of the entire negro population of continental United States. The Western states and the New England states have the smallest number, only 1.0 per cent of the negroes being found in these regions, which contain 12.8 per cent of the total population.

States and territories.—In Table VI the states and territories are arranged in the order of decreasing number of negroes living therein in 1900: It shows that more than three-tenths of the entire negro population of the country are living in the 3 adjoining states of Georgia, Alabama, and Mississippi. These, together with the adjacent Atlantic coast states of Virginia and North and South Carolina, and the 2 Gulf states of Louisiana and Texas are the only states each having over half a million negroes in 1900. Taken together these 8 states contain nearly seven-tenths of all the negroes in the country. The states with the smallest number of negroes are as a rule those at the greatest distance from these states. Thus there are 19 of the 50 states and territories which have less than 10,000 negroes each and contain together less than one two-hundredth of the negro population of continental United States, although having more than one-eighth of the total population. These 19 states include all in the Western division except California, the 3 northern New England states, and Rhode Island, Wisconsin, Minnesota, the Dakotas, and Nebraska.

In Table VII the states and territories are arranged in the order of decreasing per cent negro in total population.

Counties.—While the negro population centers in the coast states from Virginia to Texas, the counties with the largest negro population do not all lie in these states. On the contrary, the 3 counties with the largest number of negroes lie outside of this belt of states, and of the 28 counties each having more than 30,000 negroes in 1900, 9 lie outside the 8 states containing more than two-thirds of the negro population. This difference is due to the fact that there are in these 8 states few large cities, and, therefore, few counties with a very large population. The District of Columbia in area and characteristics is more like a county than a state or territory. Treating it as such it has more negroes than any other county or city in the country. It is closely followed by Shelby county, Tenn., containing Memphis, and by Baltimore city, Md., both outside the 8 states already mentioned. The 28 counties having the largest negro population in 1900 are given in Table VIII.

It is to be noted that the 28 counties include a number of the largest cities of the country: Manhattan and Bronx boroughs of New York city, Chicago, Philadelphia, St. Louis, Baltimore, Louisville, and Memphis. The total negro population of these 28 counties was 1,303,085, or 14.8 per cent of the negro population of continental United States, and 268,272 more than that of Georgia, the state with the largest negro population. The 28 counties constitute an area not much more than one-fourth (28.5 per cent) as large as that of Georgia, the difference being due largely to the fact that several of these counties are urban counties and thus have a very high density of negro population.

TABLE VIII.—*Negro population, for the 28 counties having at least 30,000 negroes: 1900.*

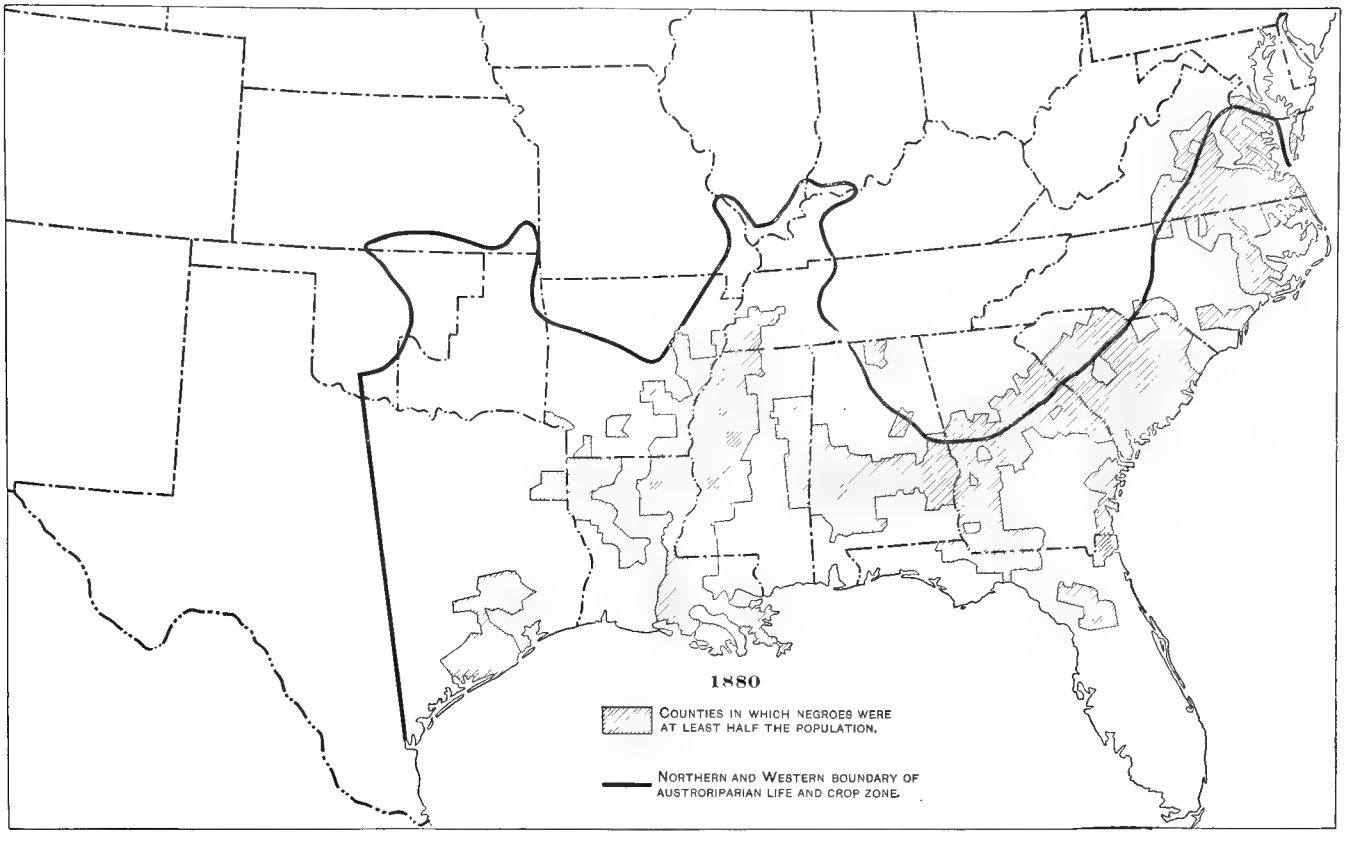
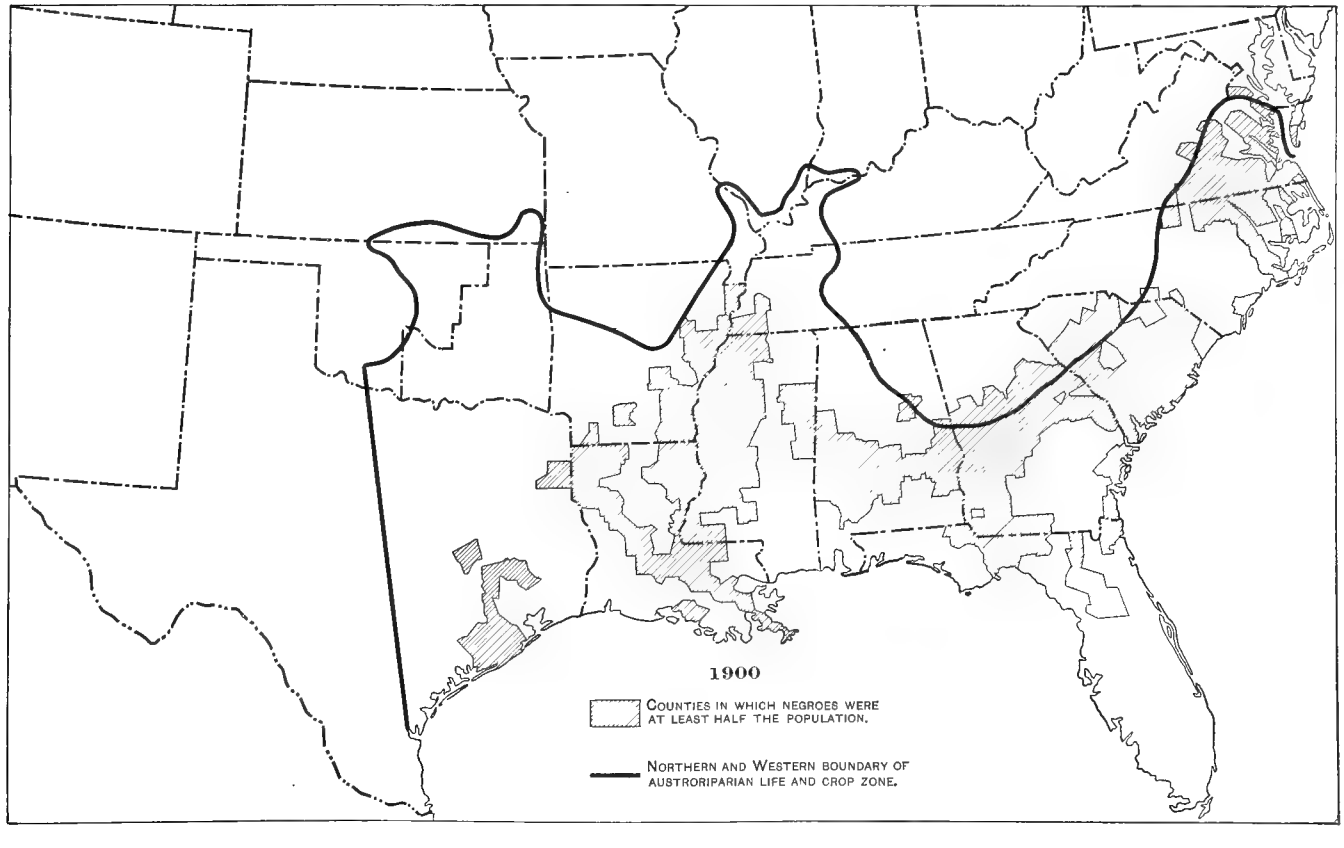
Figures for the absolute number of negroes in a county need to be supplemented by the proportion which the members of this race constitute of the entire population. The salient facts regarding this are best indicated by Plate 56 of the Statistical Atlas, which is reproduced as Map 26.



It will be noticed that the settled area of continental United States is colored in six shades of brown, the darkest representing areas having at least 60 per cent of the population negro, the lightest area having less than 1 per cent negro. The plate shows the low proportion of negroes along the northern boundary and in various islands or enclaves elsewhere. The most conspicuous inclosed areas with less than 1 per cent negro are in northern Arkansas, southern Missouri, eastern Kentucky, and central West Virginia. Smaller areas, notable because lying near the region where the negroes are most numerous, are found in northern Georgia (Gilmer county) and in northern Alabama (Cullman and Winston counties). The area with more than three-fifths of the population negro includes an isolated group of counties in southeastern Virginia and northeastern North Carolina, most of South Carolina, and a band of counties stretching across central Georgia and south-central Alabama into Mississippi, where it nearly meets the broad band of counties extending along the lower Mississippi, mostly on the eastern side. There is also a small part of this area in northwestern Louisiana reaching into northeastern Texas (Harrison and Marion counties). Other smaller areas may be noted on the map.

The scale adopted in Map 26 does not distinguish those counties in which the negroes constitute one-half or more of the total population. In order to show these counties at successive censuses, sketch maps for 1860, 1880, and 1900 have been prepared, on which the counties having at least 50 per cent negro at the date specified have been shaded by parallel lines.



MAP 27.—COUNTIES HAVING AT LEAST 50 PER CENT NEGRO IN TOTAL POPULATION: 1860.

MAP 28.—COUNTIES HAVING AT LEAST 50 PER CENT NEGRO IN TOTAL POPULATION: 1880.

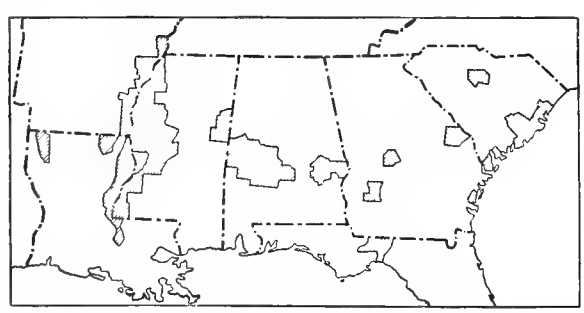
MAP 29.—COUNTIES HAVING AT LEAST 50 PER CENT NEGRO IN TOTAL POPULATION: 1900.

The Department of Agriculture has been engaged for fifteen years in defining the boundaries of the various life zones in the United States. It divides North America "into seven transcontinental belts and a number of minor areas, each of which is adapted to particular associations of animal and vegetable life." These seven belts are Arctic, Hudsonian, Canadian, Transition, Upper Austral, Lower Austral, and Tropical. Most of the area of the United States is included in the Transition and the two Austral zones. Each of these three zones is divided by an approximately north and south line at about longitude 100° into an eastern or humid and a western or arid section. The eastern section of the Lower Austral zone is called the Austroriparian. On the foregoing maps the northern and western boundaries of the Austroriparian life zone have been introduced from the latest published map of the Department of Agriculture.[1] "This is the zone of the cotton plant, sugar cane, rice, pecan, and peanut."

Inspection of these maps shows that the northern and western boundaries of what may be called "the black belt," that is, the area wherein negroes constitute at least half the population, lie, in the main, in the Austroriparian life zone and show some tendency to coincide with and run parallel to its northern and western boundaries. The maps also indicate that this rough coincidence was somewhat closer after thirty-seven years of emancipation than it was on the eve of the Civil War. The one black belt county in Kentucky, the one in central Tennessee, and the two in northern Alabama, all lying outside the Austroriparian zone, disappeared from the map by 1900. The boundaries of the two belts in eastern Maryland and Virginia more nearly coincided in 1900 than in 1860. The region in which the negroes are in greatest relative number may then be best defined in terms of these life zones. In the humid portion of the Lower Austral zone they constitute a larger proportion of the population than elsewhere in continental United States.

The states partly or entirely within or south of the Austroriparian life zone had a population in 1900 of 33,828,402 and a negro population of 7,882,827. Of the negro population in these states 5,929,979, or 75.2 per cent, resided south of the line; of the other population, substantially all white, only 32.6 per cent lived below the line; or, the ratio may be indicated in this way: Below the line 41.2 per cent of the population is negro; above it in the states cut by the line only 10.1 per cent of the population is negro.

[1] Department of Agriculture, Division of Biological Survey, Bulletin 10. Life Zones and Crop Zones, frontispiece, by C. Hart Merriam.



There are 55 counties in the United States in each of which at least three-fourths of the population are negroes. Arranged in order of decreasing proportion of negroes, they are as follows:

TABLE IX.—*Per cent negro in total population, for the 55 counties having at least 75 per cent negro in total population: 1900.*

These 55 counties lie, 19 in Mississippi, 11 in Alabama, 8 in Louisiana, 5 in Arkansas, 5 in Georgia, 4 in South Carolina, 2 in Florida, and 1 in Virginia. The location of all of them except the one in Virginia is indicated on the following cut which shows clearly that the great region of predominant negro population lies along the lower Mississippi where 29 of these 55 counties are situated:

MAP 30.—*Counties having at least 75 per cent negro in total population: 1900.*

Physiographic divisions.—For certain purposes of analysis continental United States has been divided by the Geographer of the Twelfth Census, Mr. Henry Gannett, into 19 physiographic divisions, the boundaries of which coincide with boundaries of counties. A

map of these divisions and a description of their characteristics will be found in the section on Area, pages 11 to 14. The following table gives the total population and the negro population of each of these divisions; also the per cent that the negroes make of the total population, and the per cent that the negroes in each division make of the total in continental United States:

TABLE X.—*Total population, negro population, per cent negro, and per cent distribution, for physiographic divisions: 1900.*

	1900			
DIVISION.	Total population.	Negro population.	Per cent negro in total population.	Per cent of the negro population of continental United States living in specified division.

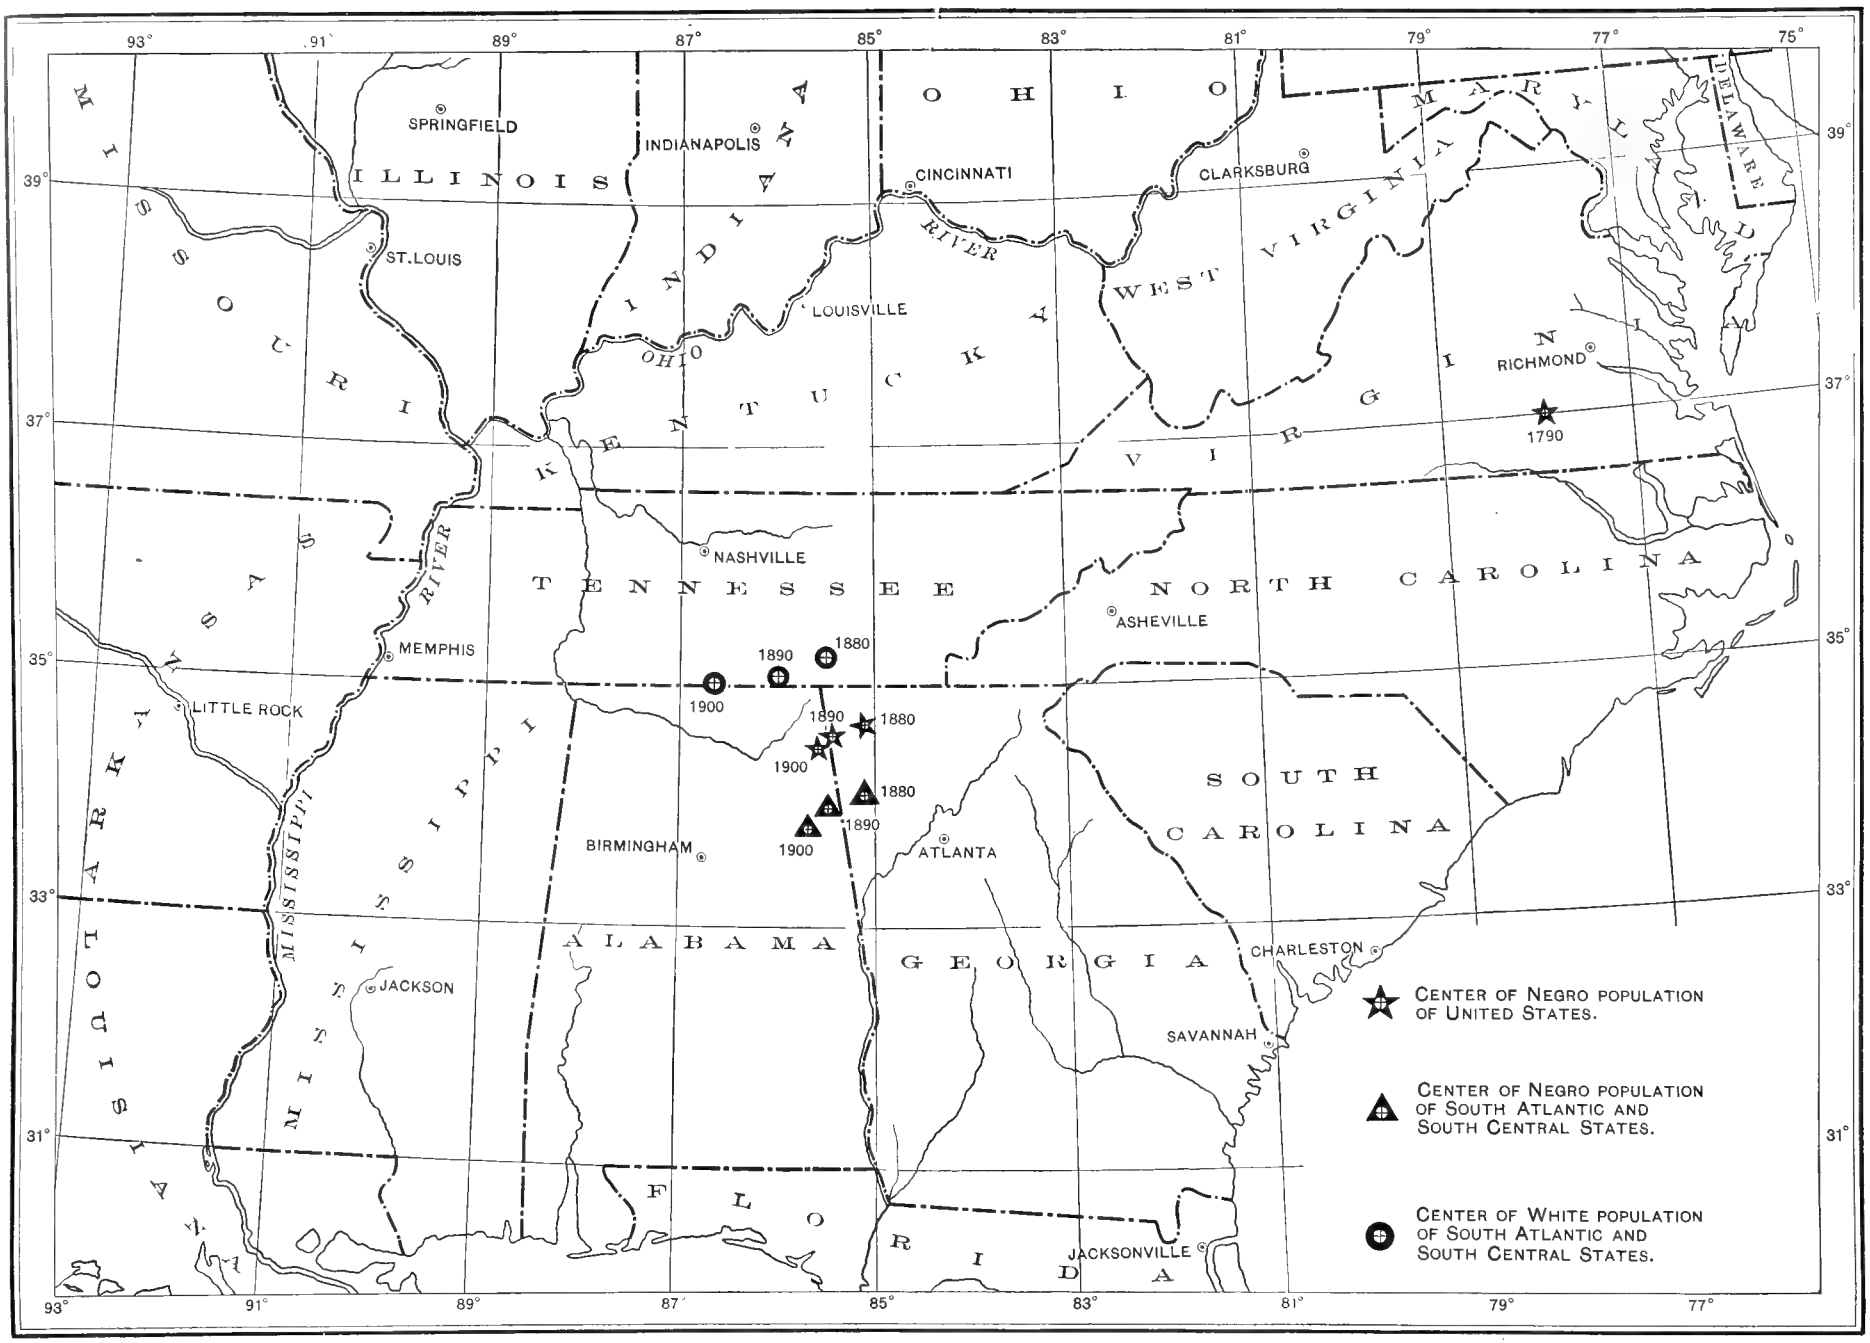
Coast ranges	1,079,992	7,671	0.7	0.1

[1] Less than one-tenth of 1 per cent.

The table shows that the negroes are found mainly in the part of the Coastal plain east of the Mississippi and in the Piedmont region, more than half of the negro population living in these two divisions. There is no other division which has half as many as either of these. Next in order of importance comes the Coast lowlands, where 795,155 negroes live, and the Mississippi alluvial region, where the number is a little less. These four physiographic divisions include more than seven-tenths of the negroes of the country. But if these divisions are considered with reference to the proportion that the negroes make of the total population of each, the order is different. There is only one, namely, the Mississippi alluvial region, in which the negroes outnumber the whites. In that division about five-eighths of the population are negro. In the Coastal plain east of the Mississippi and in the Coast lowlands over two-fifths of the population are negro, in the Coastal plain west of the Mississippi one-third, and in the Piedmont region over one-fourth. There is no other physiographic division in which the negroes constitute as much as one-tenth of the entire population.

Center and median points of negro population.—The center of negro population may be defined as follows: If the surface of the United States be conceived as a rigid plane without weight, over which the negro population is distributed as reported by the census, and if each negro be assumed to have the same weight, then the point on which such a plane balances—in other words, the center of gravity of such a system—is the center of negro population.

The median point of the negro population is the point fixed by the intersection of an east and west line and a north and south line, each of which divides the negro population of the country into two equal parts. The lines running east, south, west, and north from the median point thus divide the negro population into four groups, which are equal in number. The median point differs from the center in that it is not influenced by the distance that a particular group of negroes is from it.



The center of the negro population of continental United States in 1790, 1880, 1890, and 1900 and the centers of the negro and the white population of the South Atlantic and South Central states in 1880, 1890, and 1900 are shown on Map 31.

The center of negro population in 1880 was in northwestern Georgia, in the eastern part of Walker county. Between 1880 and 1890 it moved southwestward about 22 miles to a point in the same county about 4 miles east of the Alabama line. Between 1890 and 1900 it moved about 11 miles farther southwestward into Dekalb county, northeastern Alabama, about 4 miles west of the Georgia line.

The median point of the negro population in 1880 was also in northwestern Georgia, near the center of Bartow county, and about 34 miles southeast of the center of negro population at the same date. Between 1880 and 1890 the median point moved about 18 miles southwest into Floyd county, or slightly less than the movement of the center during the same decade. Between 1890 and 1900 it moved about 17 miles southwest into Polk county, Ga., about 4 miles east of the Alabama border. The total movement of the median point in the twenty years was about 35 miles southwestward, while that of the center was about 31 miles, the difference being due probably to the fact that a comparatively small number of negroes migrating for some distance north and northeast to northern cities have exerted more influence in retarding the southwest movement of the center than of the median point.

The center of negro population in 1790 lay in Dinwiddie county, Va., 27 miles southwest of Petersburg. Between 1790 and 1900 the center moved southwest across North Carolina and Georgia, 476 miles to the point just described, its movement from 1790 to 1880 being 443 miles, or about 49 miles in each decade. The average decennial movement before 1880 was thus more than twice that between 1880 and 1890 (22 miles), as the movement, 1880 to 1890, was twice that, 1890 to 1900 (11 miles), showing a marked slackening in the rate of movement.

MAP 31.—CENTER OF NEGRO POPULATION OF CONTINENTAL UNITED STATES, 1900, 1890, 1880, AND 1790; AND CENTER OF NEGRO AND OF WHITE POPULATION OF THE SOUTH, 1900, 1890, AND 1880.

The center of the white population of the Southern states has been for twenty years, and probably longer, in southern Tennessee. The center of the negro population of the Southern states has been southeast of that of the whites, in northern Georgia and Alabama. Map 31 shows to the eye a slight tendency to greater separation between these centers. The centers of population for southern whites and southern negroes were 80 miles apart in 1880, 79 miles in 1890, and 94 miles in 1900. This increasing separation of the centers for the two races is the resultant of an acceleration of the southerly movement and a retardation of the westerly movement of the center for the negroes, and at the same time an acceleration of the westerly movement and a retardation of the southerly movement of the center for the whites.

City and country.—The word city in this analysis, unless otherwise defined, means an incorporated place having at least 2,500 inhabitants, or a New England town of like size and not containing an incorporated place.[1] There are 32 cities in the United States, each of which had more than 10,000 negroes in 1900. Arranged in order of their negro population, they are as follows:

TABLE XI.—*Negro population, for cities having at least 10,000 negroes: 1900.*

CITY.	Negro population: 1900.	CITY.	Negro population: 1900.
32 cities	946,956	Augusta, Ga	18,487
		Kansas City, Mo	17,567
Washington, D. C	86,702	Montgomery, Ala	17,229
Baltimore, Md	79,258	Mobile, Ala	17,045
New Orleans, La	77,714	Pittsburg, Pa	17,040
Philadelphia, Pa	62,613	Birmingham, Ala	16,575
New York, N. Y	60,666	Jacksonville, Fla	16,236
Memphis, Tenn	49,910	Indianapolis, Ind	15,931
Louisville, Ky	39,139	Little Rock, Ark	14,691
Atlanta, Ga	35,727	Houston, Tex	14,608
St. Louis, Mo	35,516	Cincinnati, Ohio	14,482
Richmond, Va	32,230	Chattanooga, Tenn	13,122
Charleston, S. C	31,522	Boston, Mass	11,591
Chicago, Ill	30,150	Macon, Ga	11,550
Nashville, Tenn	30,044	Petersburg, Va	10,751
Savannah, Ga	28,090	Wilmington, N. C	10,407
Norfolk, Va	20,230	Lexington, Ky	10,130

These 32 cities have a total negro population of 946,956, or 10.7 per cent of the entire negro population of continental United States and 47.3 per cent of the negro population in all cities. Perhaps the most noteworthy indication of the table is the large number of states (20) containing at least one such city. Every Southern state, except Delaware, West Virginia, Mississippi, Indian Territory, and Oklahoma, has at least one, and there are in addition 7 Northern states, Massachusetts, New York, Pennsylvania, Ohio, Indiana, Illinois, and Missouri, of which the same is true.

The negro population of cities may be considered with reference not to the number, but to the proportion of negroes the city contains. The per cent of negroes in the population of every city having at least 25,000 inhabitants is given in Table LXXXVII; the number for every city of at least 2,500 inhabitants is given in Twelfth Census, Volume I, Table 23. From a study of these tables it will be seen that there are 72 cities in which negroes constitute at least half the population, and only 1 (Beaufort town, S. C., 78.3 per cent) in which they constitute three-fourths. On comparing the number of these cities with the number of counties in which at least three-fourths of the population is negro,[2] it appears that no cities in the United States are so predominantly negro as are many counties.

This is true even of cities along the lower Mississippi. In the following table the per cent negro in the total population of each of the 13 cities having at least 2,500 inhabitants in the Mississippi alluvial region is compared with that of the remainder of the county in which the city is situated:

CITY.	PER CENT NEGRO IN TOTAL POPULATION: 1900.	
	The city.	Rest of county.
Greenville, Washington county, Miss	65.3	94.2
Greenwood, Leflore county, Miss	62.3	92.0
Vicksburg, Warren county, Miss	54.9	85.9
Helena, Phillips county, Ark	61.3	83.2
Pine Bluff, Jefferson county, Ark	50.2	81.6
Yazoo City, Yazoo county, Miss	58.4	79.5
Shreveport, Caddo parish, La	53.3	77.7
Monroe, Ouachita parish, La	50.4	66.8
Plaquemine, Iberville parish, La	52.1	65.3
Alexandria, Rapides parish, La	55.6	53.3
Opelousas, St. Landry parish, La	54.0	50.2
Lafayette, Lafayette parish, La	46.5	40.9
Jonesboro, Craighead county, Ark	19.1	2.3

The foregoing table includes every county of the Mississippi alluvial region which contained in 1900 a city having at least 2,500 inhabitants. In 9 of the 13 counties the per cent of negroes in the population is much less for the city than for the rest of the county. To this rule there is only one noteworthy exception—Craighead county, Ark. Negroes are relatively most numerous in Washington county, Miss., but even here the per cent for the city (65.3) is only about seven-tenths that for the rest of the county (94.2).

The difference is undoubtedly due to the fact that a city is more highly organized industrially than an agricultural district, in it a greater number of occupations is represented, and higher degrees of knowledge, skill, and organizing power are required in the population. The negroes have not yet secured a standing on a level with the whites in these higher vocations, and thus no city, large or small, is manned with negroes so exclusively as many a country district. The difference is akin to that between the relatively simple agriculture in the South, especially where the negroes abound, and the more complex and diversified farming of the North.

[1] Page 20.

[2] Tables IX and LXXXVIII of this section.

Among cities having at least 25,000 inhabitants there are four with at least half of the population negro in 1900. They are Jacksonville, Fla. (57.1 per cent negro); Montgomery, Ala. (56.8 per cent negro); Charleston, S. C. (56.5 per cent negro); and Savannah, Ga. (51.8 per cent negro).

Passing now from consideration of individual cities to classes of cities and country districts, the negro population of continental United States has been distributed according to size of city of residence. For purposes of comparison the distribution of whites, Indians, and Mongolians between city and country, and among the 5 classes of cities, has been added.

TABLE XII.—POPULATION, CLASSIFIED BY RACE AND CLASS OF PLACE OF RESIDENCE, AND PER CENT DISTRIBUTION: 1900.

CLASS OF PLACE OF RESIDENCE.	Number of cities: 1900.	POPULATION: 1900.				PER CENT DISTRIBUTION BY CLASS OF PLACE OF RESIDENCE: 1900.			
		White.	Negro.	Indian.	Mongolian.	White.	Negro.	Indian.	Mongolian.

4,000 to 8,000	612	3,098,048	274,492	1,983	5,670	4.7	3.1	0.8	5.0
2,500 to 4,000	704	2,012,016	193,871	990	4,142	3.0	2.2	0.4	3.6
Country districts	.....	38,303,050	6,829,873	232,824	45,417	57.3	77.3	98.2	39.8

Table XII shows that the per cent of negroes living in cities is smaller than that of whites or of Mongolians, but very much larger than that of Indians. Comparing the two races of greatest importance, the negro and the white, it appears that more than three-fourths of the negroes live outside of cities having at least 2,500 inhabitants, while of the whites less than three-fifths live in country districts. The difference between the two is marked in each of the 5 classes of cities, but the greatest difference is in cities having at least 100,000 inhabitants. Among 1,000 negroes in continental United States 76 live in such cities, while for whites the corresponding number is 202.

This difference between whites and negroes is mainly due to the fact that nine-tenths of the negroes (89.7 per cent) and only one-fourth of the whites (24.7 per cent) live in the South Atlantic and South Central states, and that only one-seventh (14.5 per cent) of the city population of the United States is found in that section. Whether this is a complete explanation of the difference will appear when the comparison is limited to southern whites and southern negroes as in the following table:

TABLE XIII.—*Negro population and white population, by class of place of residence, and per cent distribution, for the South: 1900.*

CLASS OF PLACE OF RESIDENCE.	Number of cities: 1900.	POPULATION: 1900.		PER CENT DISTRIBUTION BY CLASS OF PLACE OF RESIDENCE: 1900.	
		Negro.	White.	Negro.	White.
South Atlantic and South Central divisions	.....	7,922,969	16,521,970	100.0	100.0
Cities having at least 2,500 inhabitants	357	1,364,796	3,051,916	17.2	18.5
Cities having a population of—					
100,000 and over	5	332,723	1,047,666	4.2	6.4
25,000 to 100,000	21	366,154	739,868	4.6	4.5
8,000 to 25,000	63	296,671	548,948	3.8	3.3
4,000 to 8,000	115	208,937	401,411	2.6	2.4
2,500 to 4,000	150	160,311	314,023	2.0	1.9
Country districts	.....	6,558,173	13,470,054	82.8	81.5

Table XIII shows that there is little difference between the two races in the Southern states. In each race nearly five-sixths of the population live outside the cities and towns of 2,500 inhabitants or more. The proportion of rural population is slightly larger among negroes, but the entire difference is due to the fact that the proportion of southern negroes living in the five cities of Baltimore, Washington, Louisville, Memphis, and New Orleans is slightly less than the proportion of southern whites.

In the following table similar figures are given for the negro and white population of the North and West:

TABLE XIV.—*Negro population and white population, by class of place of residence, and per cent distribution, for the North and West: 1900.*

CLASS OF PLACE OF RESIDENCE.	Number of cities: 1900.	POPULATION: 1900.		PER CENT DISTRIBUTION BY CLASS OF PLACE OF RESIDENCE: 1900.	
		Negro.	White.	Negro.	White.
North Atlantic, North Central, and Western divisions	.....	911,025	50,287,226	100.0	100.0
Cities having at least 2,500 inhabitants	1,504	639,326	25,454,230	70.2	50.6
Cities having a population of					
100,000 and over	33	335,531	12,459,661	36.8	24.8
25,000 to 100,000	98	102,055	4,281,959	11.2	8.5
8,000 to 25,000	322	102,624	4,317,980	11.3	8.6
4,000 to 8,000	497	65,555	2,696,637	7.2	5.3
2,500 to 4,000	554	33,560	1,697,993	3.7	3.4
Country districts	.....	271,700	24,832,996	29.8	49.4

The preceding table shows that in the North and West the negro is almost as preeminently a denizen of cities as in the South he is a denizen of country districts. In the North and West seven-tenths of the negroes and only half the whites live in cities having at least 2,500 inhabitants. The difference is most marked in the case of cities having at least 100,000 inhabitants, such cities including not quite one-fourth of the whites, but more than one-third of the negroes, the difference in this

class of cities amounting to three-fifths of that for all cities.

The distribution of the negro population between city and country may also be analyzed by considering the per cent negro in the total population, in cities and in country districts.

TABLE XV.—*Total population, negro population, and per cent negro, by class of place of residence: 1900.*

CLASS OF PLACE OF RESIDENCE.	1900		Per cent negro in total population: 1900.
	Total population.	Negro population.	
Continental United States	75,994,575	8,833,994	11.6
Cities having at least 2,500 inhabitants	30,583,411	2,004,121	6.6
Cities having a population of—			
100,000 and over	14,208,347	668,254	4.7
25,000 to 100,000	5,509,965	468,209	8.5
8,000 to 25,000	5,273,887	399,295	7.6
4,000 to 8,000	3,380,193	274,492	8.1
2,500 to 4,000	2,211,019	193,871	8.8
Country districts	45,411,164	6,829,873	15.0

The negroes, constituting about one-ninth of the total population, constitute only about one-fifteenth of the urban population and more than one-seventh of the rural population. They are relatively least numerous in the large cities, and with a single exception, in the case of cities of 25,000 to 100,000 inhabitants, the proportion of negroes increases as the transition is made from populous centers to country districts. These differences may be due entirely, as they certainly are in large part, to the fact that the cities, and especially the large cities, lie in most instances at a distance from the main residence section of the negro. In the following table, therefore, the facts are given separately for the South and the North and West:

TABLE XVI.—*Total population, negro population, and per cent negro, by class of place of residence, for the South and the North and West: 1900.*

CLASS OF PLACE OF RESIDENCE.	1900		Per cent negro in total population: 1900.
	Total population.	Negro population.	
South Atlantic and South Central divisions	24,523,527	7,922,969	32.3
Cities having at least 2,500 inhabitants	4,420,885	1,364,796	30.9
Cities having a population of—			
100,000 and over	1,381,830	332,723	24.1
25,000 to 100,000	1,106,723	366,154	33.1
8,000 to 25,000	846,404	296,671	35.1
4,000 to 8,000	611,218	208,937	34.2
2,500 to 4,000	474,710	160,311	36.8
Country districts	20,102,642	6,558,173	32.6
North Atlantic, North Central, and Western divisions	51,471,048	911,025	1.8
Cities having at least 2,500 inhabitants	26,162,526	639,325	2.4
Cities having a population of—			
100,000 and over	12,826,517	335,531	2.6
25,000 to 100,000	4,403,242	102,055	2.3
8,000 to 25,000	4,427,483	102,624	2.3
4,000 to 8,000	2,768,975	65,555	2.4
2,500 to 4,000	1,736,309	33,560	1.9
Country districts	25,308,522	271,700	1.1

In the Southern states the per cent negro in the several classes of cities and in country districts, as in the region as a whole, is very close to one-third, the only exception being in the case of the five cities having at least 100,000 inhabitants, for which group the proportion falls to one-fourth. In the North and West the negroes constitute a proportion more than twice as high in cities as in country districts, and in general the smaller the cities the less the per cent of negroes in the population.

In the following table the per cent negro in the population of each class of cities and in country districts is given for each Southern state and territory:

TABLE XVII.—*Per cent negro in total population of each class of cities and of country districts: 1900.*

STATE OR TERRITORY.	PER CENT NEGRO IN TOTAL POPULATION: 1900.							
	Per cent negro in the population of the state or territory: 1900.	Of cities having—						Of country districts.

Texas	20.4	22.9	.....	21.3	22.0	22.8	29.9	19.8

Among the 5 southern cities having at least 100,000 inhabitants, the largest per cent of negroes is found in Memphis (48.8), then Washington (31.1), New Orleans (27.1), Louisville (19.1), and Baltimore (15.6). In the group of southern cities having 25,000 to 100,000 inhabitants, there are 4 with a higher per cent of negroes than any of these, namely, Jacksonville (57.1), Montgomery (56.8), Charleston (56.5), and Savannah (51.8). In the group of cities having 8,000 to 25,000 inhabitants, the largest per cent of negroes is found in Louisiana, where in both Baton Rouge (58.5) and Shreveport (53.3) more

than half the population is negro. The 12 cities in Georgia having between 4,000 and 8,000 inhabitants, have 48.2 per cent of their combined population negro. The 6 cities in Florida, having between 2,500 and 4,000 inhabitants, have 53.5 per cent of their combined population negro. In South Carolina, Mississippi, and Louisiana more than half of the population of the country districts is negro.

It is sometimes alleged that the migration to cities, which has characterized nearly all countries and all classes of population during the last half century, has affected southern whites more than southern negroes, and that the latter race is thus being segregated in the rural districts. That such a movement may have gone on or may be now in progress in parts of the South can neither be affirmed nor denied on the basis of the present figures, but it may be said with some confidence that, as a general statement applied to the whole South, it is not correct. To be sure the negroes constitute 32.6 per cent of the population of the country districts in the entire South and only 30.9 per cent of the city population, but an examination of the figures in the preceding table for the several divisions and states will show that what is in some degree true of the South as a whole is not true of most of its parts. On the contrary, the distribution varies according to local conditions. In Delaware, Maryland, South Carolina, Georgia, Mississippi, and Louisiana the negroes are most numerous in the country, but in the other Southern states the reverse is true, and in a number the difference either way is so slight as to be insignificant.

INCREASE OF NEGROES.

Continental United States.—Table XVIII shows the negro population at each of the twelve censuses, the numerical increase, and the per cent of increase in each decade. It will be noticed that the series of increases is quite irregular, especially since the Civil War. An investigation made at the time of the Tenth Census established beyond question the fact that serious omissions, especially in the Southern states and among the negro population, vitiated the census of 1870, taken under a most unsatisfactory system and at a time when the disorganization following the Civil War was a serious obstacle. To avoid the use of the inaccurate figures for that census, another column has been introduced showing the per cent of increase of the negro population for each twenty-year period during the nineteenth century. For purposes of comparison the corresponding per cents of increase of the white population in each decade and each twenty-year period have been added.

TABLE XVIII.—*Negro population and number and per cent of increase by ten and twenty year periods: 1790 to 1900.*

[1] Includes population of Indian Territory and Indian reservations.
[2] Excludes population of Indian Territory and Indian reservations.

The highest rate of increase for the negro population was during the decade from 1800 to 1810, a decade including the last eight years of the period during which the importation of slaves was authorized by law. This maximum rate of increase may be compared with those of the whites between 1840 and 1850, and 1850 and 1860, when the large immigration from Europe was probably a more potent influence upon the increase of white population than at any earlier or later period. It is noteworthy that in every decade, except that between 1800 and 1810, probably affected by the slave trade, and that between 1870 and 1880, certainly affected by the errors in the earlier census, the decennial rate of increase of the white population has been greater than that of the negroes. Confining attention to the per cents of increase for twenty-year periods, it appears also that those for the negroes steadily declined throughout the nineteenth century, while those for the whites were highest during the period from 1840 to 1860, but have declined since that time. The decrease of 14 in the per cent of increase of the negroes during the twenty years, 1880 to 1900, when compared with that during the twenty years, 1860 to 1880, is also much greater than the corresponding decrease (7.3) in the rate of growth among the whites.

The objection to such comparisons, that the white population is concentrated in the North and West and the negro population in the South, that until the last ten years the rate of growth of the North and West has been uniformly more rapid than that of the South, and that the less rapid rate of growth on the part

of the negro race may be due to the differences between the sections, rather than to any differences between the races themselves, deserves attention. To determine its validity, the comparison has been limited in Table XIX to the Southern states.

TABLE XIX.—*Negro population and number and per cent of increase by ten and twenty year periods, for the South: 1790 to 1900.*

CENSUS.	Negro population.	INCREASE OF NEGRO POPULATION DURING—				PER CENT OF INCREASE OF WHITE POPULATION DURING—

1790	689,784	.....	.....	.....	.....	.....	.....

[1] Includes population of Indian Territory and Indian reservations.
[2] Excludes population of Indian Territory and Indian reservations.

If attention be confined to the twenty-year periods one notices that the rate of increase for the negro population of the Southern states declined steadily throughout the nineteenth century, its per cent of increase, 1880 to 1900, being less than half what it was 1800 to 1820. The rate of increase of the southern whites has been very different. From 1800 to 1840 it was less than that of the negroes, both for each twenty-year period and for each decade. From 1840 to 1900, with the apparent but probably not real exception of 1870 to 1880, the per cent of increase of southern whites in each decade has been greater than that of negroes. Neither is any clear tendency to a declining rate of growth traceable for the whites. On the contrary the increase, 1880 to 1900, was greater not merely than 1860 to 1880, including the Civil War, but also greater than 1820 to 1840. During the last twenty years the per cent of increase of southern whites has been fully seven-tenths greater than that of southern negroes. If the per cents during sixty years of slavery, 1800 to 1860, and forty years, mainly of freedom, 1860 to 1900, be compared, it appears that from 1800 to 1860 the southern whites increased 312.9 per cent and the southern negroes 346.1 per cent; but 1860 to 1900 the southern whites increased 134.9 per cent and the southern negroes 93.4 per cent.

A similar comparison has been made excluding the Southern states west of the Mississippi river. Table XX shows the increase of negroes and whites for this area by ten and twenty year periods through the last century:

TABLE XX.—*Negro population and number and per cent of increase by ten and twenty year periods, for the South east of the Mississippi: 1790 to 1900.*

CENSUS.	Negro population.	INCREASE OF NEGRO POPULATION DURING—				PER CENT OF INCREASE OF WHITE POPULATION DURING—	
		Preceding ten years.		Preceding twenty years.		Preceding ten years.	Preceding twenty years.
		Number.	Per cent.	Number.	Per cent.		
South Atlantic and Eastern South Central divisions:							
1900	6,228,903	846,416	15.7	1,362,705	28.0	18.7	41.4
1890	5,382,487	516,289	10.6	.....	.....	19.1	.....
1880	4,866,198	1,185,241	32.2	1,413,640	40.9	26.4	40.1
1870	3,680,957	228,399	6.6	.....	.....	10.8	.....
1860	3,452,558	468,897	15.7	1,024,935	42.2	17.3	45.6
1850	2,983,661	556,038	22.9	.....	.....	24.2	.....
1840	2,427,623	396,753	19.5	866,167	55.5	18.7	51.4
1830	2,030,870	469,414	30.1	.....	.....	27.5	.....
1820	1,561,456	335,202	27.3	643,120	70.0	24.7	57.9
1810	1,226,254	307,918	33.5	.....	.....	26.6	.....
1800	918,336	228,552	33.1	.....	.....	34.0	.....
1790	689,784	.....	.....	.....	.....	.....	.....

The same results appear for this area as for the entire South. At each decade between 1800 and 1840 the per cent of increase of negroes was greater than that of whites; at each later decade with the doubtful exception of 1870 to 1880 the per cent of increase of whites was greater than that of negroes. It is difficult to understand the apparent fact that the per cent of increase of the negroes, 1890 to 1900, was greater by 5.1 than 1880 to 1890, while the per cent of increase of the whites in the same region was 0.4 less in the later decade than in the earlier. If one suppose that the census of 1890 failed to include a decidedly larger proportion of negroes at the South than that of 1880 or 1900, it would be the simplest and most obvious explanation of the facts. While firmly convinced by a careful independent examination of the evidence that the Eleventh Census was substantially accurate for the country as a whole, I believe that the possibility of serious omissions in the count of negroes in 1890 is not to be left out of account. Judgment on this point must be reserved till more evidence comes to light.

Main geographic divisions.—For reasons already assigned it seems best to study the increase of negro population by twenty-year periods. The figures for each ten-year period will be found in Table LXXVI of this section. Those for each twenty-year period are given in the following table, and for purposes of comparison

the corresponding rates for the whites have been introduced:

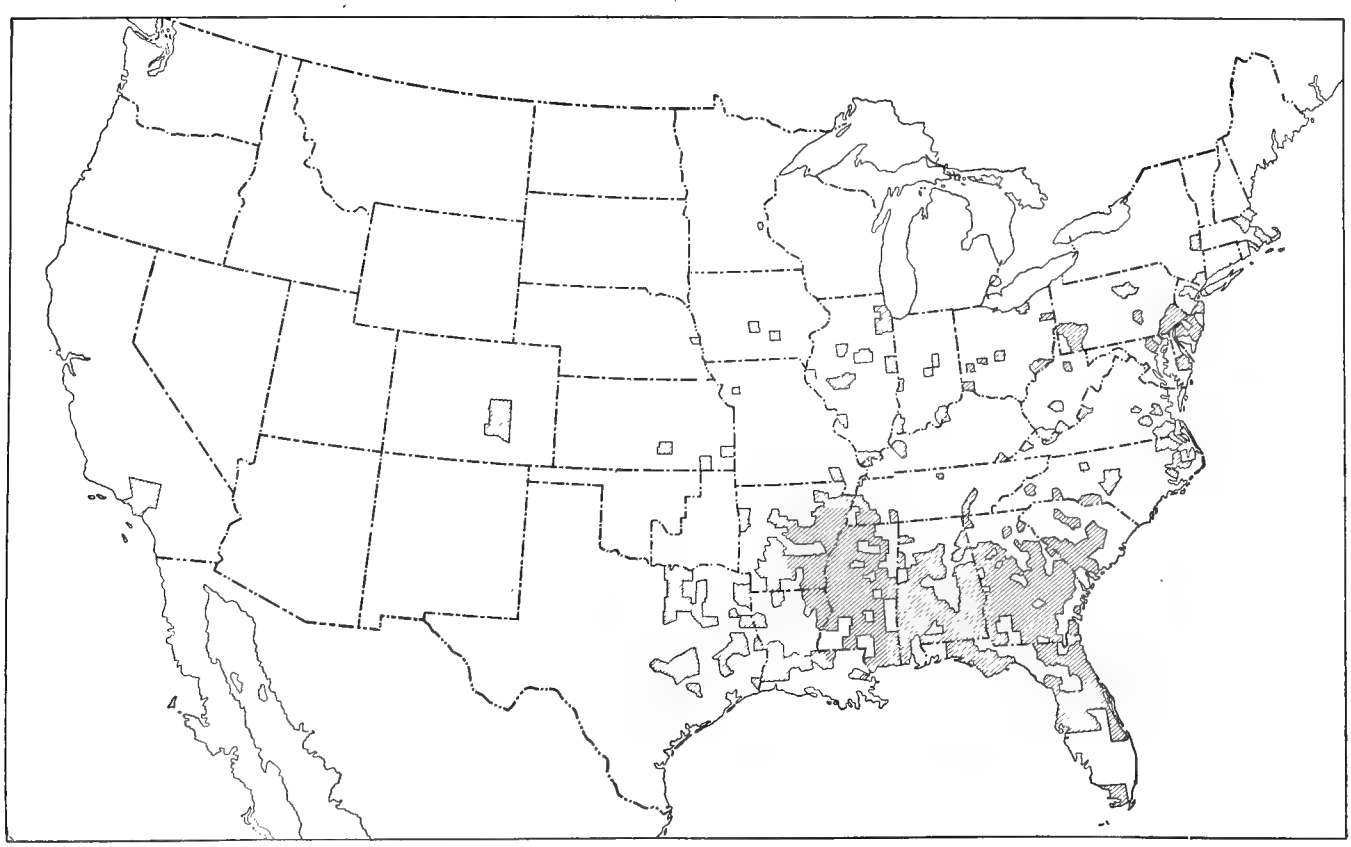

TABLE XXI.—*Per cent of increase by twenty-year periods, for the negro and the white population, by main geographic divisions: 1800 to 1900.*

DIVISION.	PER CENT OF INCREASE.				
	1880 to 1900	1860 to 1880	1840 to 1860	1820 to 1840	1800 to 1820
North Atlantic:					
Negro population	67.8	47.1	9.6	28.5	33.3
White population	44.6	36.7	57.7	55.8	66.6
South Atlantic:					
Negro population	26.8	42.9	28.9	25.4	48.1
White population	44.1	40.8	42.0	30.2	25.3
North Central:					
Negro population	28.6	109.3	106.2	389.3	2,775.6
White population	52.6	90.6	172.8	287.9	1,569.7
South Central:					
Negro population	39.2	47.8	95.2	182.9	529.7
White population	66.3	58.3	88.3	100.3	257.3
Western:					
Negro population	155.3	164.6	.....	.....	.....
White population	140.2	192.8	.....	.....	.....

In the North Atlantic states the twenty-year increase of negroes was at a decreasing rate from 1800 to the date of the Civil War, but since that time the rate has increased, and for the last ten years was more than twice that of the whites. But even now the negroes constitute less than 2 per cent of the population. They are most numerous relative to total population in New Jersey, but Maine, New York, and Pennsylvania are the only states in which their per cent of increase, 1890 to 1900, was twice that of the whole population. In the South Atlantic states the maximum rate of increase was from 1800 to 1820, due to the rapid importation of slaves just before the slave trade was declared illegal in 1808. A second maximum was reached in 1860 to 1880. In the other twenty-year periods the rate of increase has been about the same. In the North Central division the highest rates of increase of the negroes were in the periods 1800 to 1820 and 1820 to 1840, and the rate from 1860 to 1880 was greater than that in the twenty years immediately preceding the Civil War. The decrease in rate of growth in that division during the last twenty years has been very marked, the per cent of increase from 1880 to 1900 being little more than one-fourth of that during the preceding twenty years. This is due in part to the rapid checking of the rate of growth in the whole population, but only in part, for while from 1860 to 1880 the rate of increase of the negroes in that section was greater than that of the whites, from 1880 to 1900 it was little more than half as great. In the South Central division the per cent of increase of the negroes was at its maximum during the first twenty years of the nineteenth century, and at its minimum during the last twenty years. In the white population of this section the rate of increase declined from 1800 to 1880, but for the last twenty years the increase of whites was greater than from 1860 to 1880.

The concentration of increase of negroes relative to that of whites in the southern belt of states and in scattered urban counties of the North is well indicated by Map 32, on which the shaded area is that of counties having a larger proportion of negroes in 1900 than in 1880 and having at least 1,000 negroes in 1900.

MAP 32.—COUNTIES HAVING A HIGHER PER CENT NEGRO IN TOTAL POPULATION IN 1900 THAN IN 1880 AND HAVING AT LEAST 1,000 NEGROES IN 1900.

City and country.—The city population of the United States increases, not merely by the increase of population within the limits of incorporation, but also by annexation of territory as the areas of dense population extend, and by the appearance of new cities. It is impracticable under present conditions to make allowance for changes of municipal boundaries, usually by annexation of territory, but the increase of city population may be analyzed in two ways, one disregarding and the other regarding the rise of new city centers. By the former method city population is taken to include all those living in cities having at least 2,500 inhabitants at the specified date; and the increase of city population, 1890 to 1900, would be the difference between the total population of the 1,490 such cities in 1890 and the 1,861 such cities in 1900. By the latter method the classification of a place is determined by its population in 1900 and the increase of city population would be the increase, 1890 to 1900, in the population of the 1,861 cities which in 1900 had at least 2,500 inhabitants.

Both methods have been applied to the study of the increase of the negro population in city and country, but with slight modifications. In 1880 the negro population was not separately reported for cities having less than 4,000 inhabitants, and for this reason when a study of increase for the last two decades is to be made the limit must be drawn at a population of 4,000 in 1880. In 1890 and 1900 the negro population was not separately reported for places of less than 2,500 inhabitants. The second method of analyzing increase for that decade, accordingly, can be applied only to those places which had more than 2,500 inhabitants at each date, excluding all which crossed that limit in either direction between 1890 and 1900.

The negro and white population of cities and of country districts in 1890 and 1900 and the decennial increase are given in Table XXII:

TABLE XXII.—NEGRO POPULATION AND WHITE POPULATION, AND NUMBER AND PER CENT OF INCREASE, FOR CITY AND COUNTRY: 1900 AND 1890.

	NUMBER OF CITIES.		POPULATION.				INCREASE OF POPULATION: 1890 TO 1900.			
			Negro.		White.		Number.		Per cent.	
	1900	1890	1900	1890	1900	1890	Negro.	White.	Negro.	White.
Continental United States			8,833,994	7,488,676	66,809,196	55,101,258	1,345,318	11,707,938	18.0	21.2
Cities having at least 2,500 inhabitants	1,861	1,490	2,004,121	1,482,651	28,506,146	21,011,367	521,470	7,494,779	35.2	35.7
Country districts			6,829,873	6,006,025	38,303,050	34,089,891	823,848	4,213,159	13.7	12.4

The preceding table shows that the negro population of cities is increasing more than two and one-half times as fast as the country districts and that its rates of increase correspond very closely with those for the whites, being in the country districts a little greater and in the cities a little less. But the conditions affecting increase in the North and South are so diverse that the figures for the South alone must be added. They are given in Table XXIII:

TABLE XXIII.—NEGRO POPULATION AND WHITE POPULATION, AND NUMBER AND PER CENT OF INCREASE, FOR CITY AND COUNTRY IN THE SOUTH: 1900 AND 1890.

	NUMBER OF CITIES.		POPULATION.				INCREASE OF POPULATION: 1890 TO 1900.			
			Negro.		White.		Number.		Per cent.	
	1900	1890	1900	1890	1900	1890	Negro.	White.	Negro.	White.
South Atlantic and South Central divisions			7,922,969	6,760,577	16,521,970	13,193,453	1,162,392	3,328,517	17.2	25.2
Cities having at least 2,500 inhabitants	357	255	1,364,796	1,035,494	3,051,916	2,232,428	329,302	819,488	31.8	36.7
Country districts			6,558,173	5,725,083	13,470,054	10,961,025	833,090	2,509,029	14.6	22.9

The negro population of southern cities increased 31.8 and that of whites 36.7 per cent, a large part of this increase being due to the increase of 102 in the number of cities. Meantime the increase of negroes in the country districts was 14.6, and of whites 22.9 per cent. The difference between city and country in the case of the negroes was much greater than it was in the case of the whites. In the country districts of the South the negroes increased about two-thirds as fast as the whites; in the cities they increased nearly seven-eighths as fast.

Under the method of studying increase thus far employed it is impossible to determine how much or what sort of influence was exerted upon the figures by the

102 southern cities which passed the 2,500 limit between 1890 and 1900. The second method of analysis, wherein the number of cities is the same at both censuses, is, therefore, of greater importance for present purposes. Under this method the study must be limited, as already explained, to the cities having at least 2,500 inhabitants in both 1900 and 1890. There are 242 such cities in the South.

The figures for these cities and the country districts in the South are as follows:

	POPULATION.				INCREASE OF POPULATION: 1890 TO 1900.			
	Negro.		White.		Number.		Per cent.	
	1900	1890	1900	1890	Negro.	White.	Negro.	White.
South Atlantic and South Central divisions	7,922,969	6,760,577	16,521,970	13,193,453	1,162,392	3,328,517	17.2	25.2
242 cities	1,245,990	1,023,583	2,790,228	2,206,431	222,407	583,797	21.7	26.5
Country districts	6,676,979	5,736,994	13,731,742	10,987,022	939,985	2,744,720	16.4	25.0

The foregoing figures show that negroes in the 242 southern cities increased 1890 to 1900 nearly one-third faster than negroes in the country districts. But in country districts of the South negroes increased only two-thirds as fast as whites. The table brings out the striking fact that the white population of the South is increasing in the country almost as rapidly as in the cities, and that what difference there is between city and country increase in the South is due almost entirely to the more rapid increase of negroes in the cities.

In the following table, the figures are shown for the 242 cities classified by size in 1900:

	Number of cities.	POPULATION.				INCREASE OF POPULATION: 1890 TO 1900.			
		Negro.		White.		Number.		Per cent.	
		1900	1890	1900	1890	Negro.	White.	Negro.	White.
South Atlantic and South Central divisions		7,922,969	6,760,577	16,521,970	13,193,453	1,162,392	3,328,517	17.2	25.2
Cities having at least 2,500 inhabitants in 1900 and 1890	242	1,245,990	1,023,583	2,790,228	2,206,431	222,407	583,797	21.7	26.5
Having in 1900 a population of—									
100,000 and over	5	332,723	264,524	1,047,666	867,437	68,199	180,229	25.8	20.8
25,000 to 100,000	24	366,154	304,853	739,868	593,073	61,301	146,795	20.1	24.8
8,000 to 25,000	63	296,671	249,663	548,948	402,649	47,008	146,299	18.8	36.3
4,000 to 8,000	96	183,285	142,363	340,340	243,246	40,922	97,094	28.7	39.9
2,500 to 4,000	54	67,157	62,180	113,406	100,026	4,977	13,380	8.0	13.4
Country districts		6,676,979	5,736,994	13,731,742	10,987,022	939,985	2,744,720	16.4	25.0

These figures show that the negro population is increasing most rapidly in the large cities and in those of 4,000 to 8,000 inhabitants. The cities having at least 100,000 inhabitants are the only class of southern cities in which the increase of negroes is more rapid than that of whites. There are in the South 5 such cities—Baltimore, Washington, Louisville, Memphis, and New Orleans—and the rates of increase of negroes and whites in each were:

CITY.	PER CENT OF INCREASE: 1890 TO 1900.	
	Negro population.	White population.
Baltimore	18.1	16.9
Washington	14.7	23.8
Louisville	36.6	25.0
Memphis	73.9	46.5
New Orleans	20.5	17.8

These figures indicate that the negroes have increased faster than the whites in every large southern city except Washington. The following table shows for continental United States the increase of negroes and of whites in the 38 cities having at least 100,000 inhabitants in 1900 and in the rest of the country:

	POPULATION.		INCREASE OF POPULATION: 1890 TO 1900.	
	1900	1890	Number.	Per cent.
Continental United States:				
38 cities—				
Negro	668,254	484,346	183,908	38.0
White	13,507,327	10,181,905	3,325,422	32.7
Rest of country—				
Negro	8,165,740	7,004,330	1,161,410	16.6
White	53,301,869	44,919,353	8,382,516	18.7

These figures show that in the large cities of the country as a whole negroes are increasing at a somewhat higher rate than whites. This is the more noteworthy both because in the country as a whole and in the country outside these cities the increase of negroes is somewhat slower than that of whites and also because 33 of these 38 large cities lie outside of the Southern states, in which nearly nine-tenths of the negroes live, so that the rapid increase of their negro population must involve in many cases long-distance migration.

SEX.

Continental United States.—Table 16 shows that in continental United States there were a few more females than males among the negro population. Computing the proportions, it will appear that in every 1,000 negroes there were on the average 497 males and 503 females, or an excess of 6 females in each 1,000. The difference is slight, but it is noteworthy that the negro race is the only one in continental United States of which this is true. Among the whites there are 512 males and 488 females in each 1,000 of population, or an excess of 24 males. Among the Mongolians—that is, the Chinese and Japanese—there are 952 males and only 48 females, or an excess of 904 males in each 1,000. It might be said that for each of these classes the difference is due to immigration, and that the negroes have a slight excess of females because the negro immigration since 1808 has been insignificant. No such explanation, however, would apply to the Indian population, and yet among them there are 504 males and 496 females to each 1,000, or an excess of 8 males. Neither would it apply to the native white, and yet among 1,000 of these there are 507 males and only 493 females, or an excess of 14 males. The evidence, therefore, seems to indicate that the negroes, unlike the Indians and the native whites, have a slight preponderance of females. The examination of the figures in Table 16 in detail shows that this slight excess of females is found in both Atlantic divisions and in the South Central division, while in the North Central and Western divisions there is an excess of males. In every state west of the Mississippi except Louisiana and Texas the male negroes outnumber the female. The same is true of every state north of the Ohio. In addition to these one finds there was a greater number of males in Maine, Vermont, Pennsylvania, Delaware, West Virginia, and Florida. It is clear that the preponderance of males is due largely to the fact that they are the more migratory sex and therefore are found in greater numbers in regions where the negro population is maintained mainly by immigration rather than by the rearing of children. To certain regions, especially those containing a large city population, negro women have migrated apparently in somewhat larger numbers than the men.

City and country.—The negro population of continental United States has been reported with distinction of sex for all cities having at least 2,500 inhabitants. The contrast between city and country is shown in the following table:

TABLE XXIV.—*Negro population, classified by sex and per cent distribution by sex, for city and country: 1900.*

	NEGRO POPULATION: 1900.				
	Total.	Male.	Female.	Per cent male.	Per cent female.
Continental United States.	8,833,994	4,386,547	4,447,447	49.7	50.3
Cities having at least 2,500 inhabitants	2,004,121	936,731	1,067,390	46.7	53.3
Country districts	6,829,873	3,449,816	3,380,057	50.5	49.5

The preceding figures show that in the cities of continental United States, taken collectively, female negroes outnumber the male by 66 per thousand of total negro population, and in the country districts, on the contrary, male negroes outnumber female by 10 per thousand, or a difference between city and country of 38 per thousand. The same difference holds for the white race, but in a far less degree, Table XXV showing a difference between city and country of only 25 per thousand.

TABLE XXV.—*White population, classified by sex and per cent distribution by sex, for city and country: 1900.*

	WHITE POPULATION: 1900.				
	Total.	Male.	Female.	Per cent male.	Per cent female.
Continental United States.	66,809,196	34,201,735	32,607,461	51.2	48.8
Cities having at least 2,500 inhabitants	28,506,146	14,187,311	14,318,835	49.8	50.2
Country districts	38,303,050	20,014,424	18,288,626	52.3	47.7

In the following table the per cents for 1890 are brought into comparison with those for 1900. But in order to make the comparison exact, the figures for all non-Caucasians—that is, the negroes, Indians, and Mongolians—have been used for both dates, those for negroes alone not having been separately tabulated in 1890.

TABLE XXVI.—*Per cent distribution of the negro, Indian, and Mongolian population by sex, for city and country: 1900 and 1890.*

	NEGRO, INDIAN, AND MONGOLIAN POPULATION.			
	1900		1890	
	Per cent male.	Per cent female.	Per cent male.	Per cent female.
Continental United States	50.2	49.8	50.6	49.4
Cities having at least 2,500 inhabitants	48.3	51.7	48.9	51.1
Country districts	50.8	49.2	51.0	49.0

The foregoing figures show that in 1900, counting the negroes, Indians, Chinese, and Japanese together, there are in the cities per thousand of population 34 more females than males, and that the difference in this respect has increased rapidly since 1890, when it was only 22 per thousand. Among the non-Caucasians in the country districts at each census there was an excess of males, but the excess was slightly less in 1900 than in 1890 (16 per thousand in 1900 as compared with 20 per thousand in 1890). The net result of these changes was to accentuate slightly the difference between city and country, which was 21 per thousand in 1890 and 25 per thousand in 1900.

The figures of Table XXVI are complicated by the massing of the city population in the North and West and of the negro population in the South. To avoid error from that source the comparison has been limited to the South in the following table:

TABLE XXVII.—*Negro population, classified by sex and per cent distribution by sex, for city and country in the South: 1900.*

	NEGRO POPULATION: 1900.				
	Total.	Male.	Female.	Per cent male.	Per cent female.
South Atlantic and South Central divisions	7,922,969	3,925,404	3,997,565	49.5	50.5
Cities having at least 2,500 inhabitants	1,364,796	622,509	742,287	45.6	54.4
Country districts	6,558,173	3,302,895	3,255,278	50.4	49.6

The foregoing figures show that when attention is confined to negroes in the South, the difference between city and country is more marked. In the negro population of southern cities there are 119,778 more females than males; in the country districts there are 47,617 more males than females. Among each 1,000 negroes in southern cities there are 88 more females than males; among each 1,000 negroes outside the cities there are 8 more males than females. The corresponding excess of female whites in southern cities is 12 per thousand; that of male whites in southern country districts is 28. The great difference between city and country for the negroes is probably due in large part, but not entirely, to the fact that employment in cities is more easily found by negro women than by negro men.

In order to get light upon the changes during the decade 1890 to 1900, the per cents for negroes, Indians, and Mongolians, the only figures available for 1890, have been obtained.

TABLE XXVIII.—*Per cent distribution of the negro, Indian, and Mongolian population by sex, for city and country in the South: 1900 and 1890.*

	NEGRO, INDIAN, AND MONGOLIAN POPULATION.			
	1900		1890	
	Per cent male.	Per cent female.	Per cent male.	Per cent female.
South Atlantic and South Central divisions	49.6	50.4	49.8	50.2
Cities having at least 2,500 inhabitants	45.7	54.3	46.0	54.0
Country districts	50.4	49.6	50.5	49.5

The figures show that the excess of females among the city non-Caucasians of the South has slightly increased, from 80 per thousand in 1890 to 86 per thousand in 1900. In the country districts there was at each census an excess of males which was, however, slightly less in 1900 (8 per thousand) than in 1890 (10 per thousand). The net result of these changes was to increase a little the dissociation of the sexes among the non-Caucasians, the difference between city and country in 1890 being 45 per thousand and in 1900, 47 per thousand.

AGE.

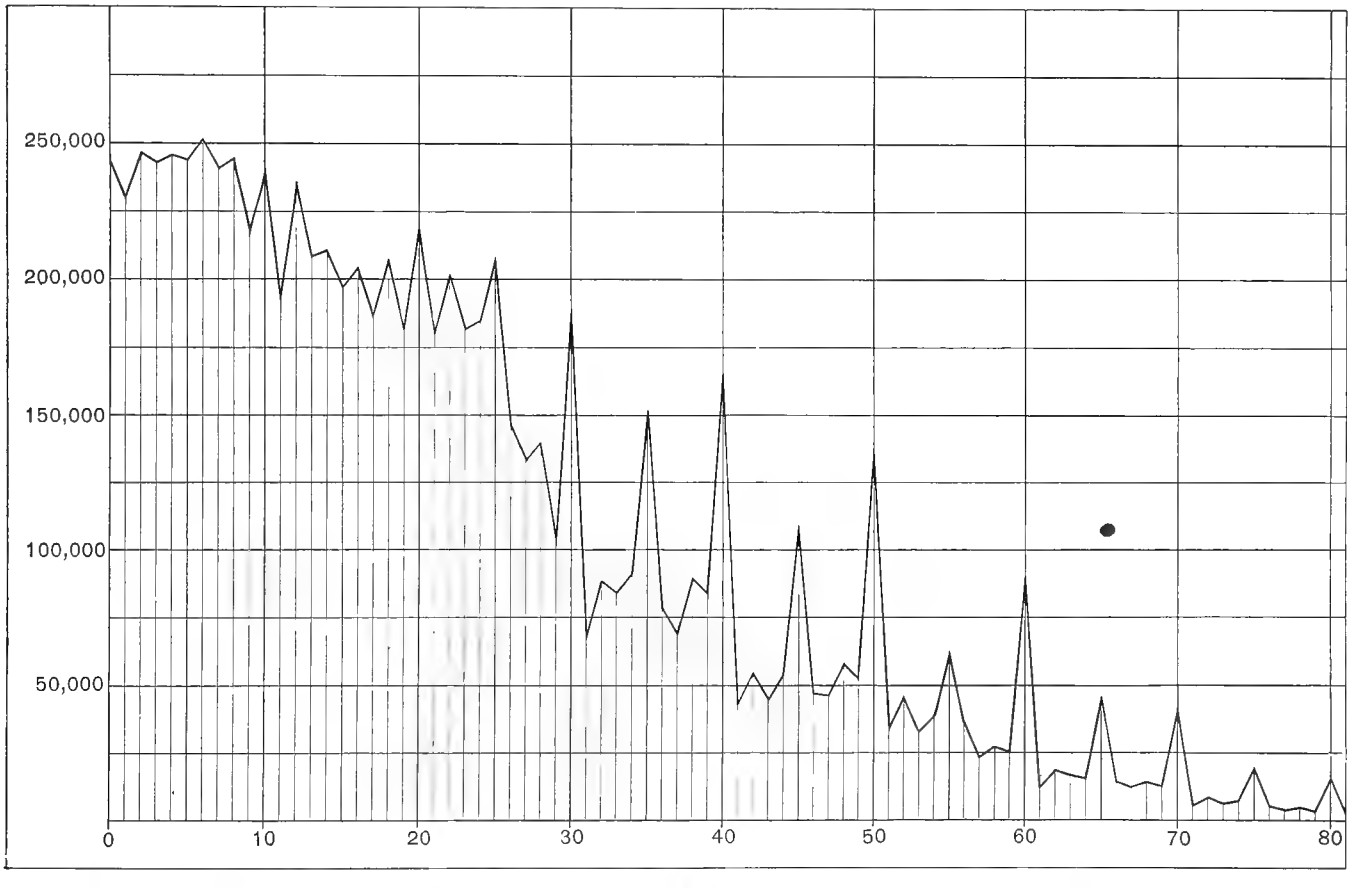
Differences in figures for 1890.—The general enumeration in 1890 did not include the population of Indian Territory and the Indian reservations. The population of those areas (white, 117,368; negro, 18,636; Indian, 189,447; Chinese, 13) was enumerated by the special Indian census, and the classifications by sex and race were made, but information regarding age, birthplace, illiteracy, conjugal condition, and occupations was not returned. In the preceding topics, therefore, the figures for 1890 exclude the population of Indian Territory and Indian reservations. This explains certain differences between the following tables and those that precede. Thus, in Table XLIII of this section the negro population in 1890 is stated as 7,470,040, while in Table XXII of this section the negro population considered for 1890 is 7,488,676. The difference of 18,636 is due to that number of negroes returned for Indian Territory by the special Indian census and classified by sex but not by marital condition.

Nature of inquiry.—At the Twelfth Census the age at last birthday of every person in the United States was asked by the enumerators. The instructions given on this topic were as follows:[1]

Column 8. Age at last birthday.—The object of this question is to get the age of each person in completed years, or in the case of a child under 1 year the age in completed months.

[1] Instructions to Enumerators, 1900, sections 131 and 132.

For each person 1 year of age or over, enter the age at *last* birthday in whole years, omitting months and days. For children who, on the first day of June, 1900, were less than 1 year of age, enter the age in months, or twelfths of a year, thus: $\frac{3}{12}$, $\frac{7}{12}$, $\frac{8}{12}$. For a child less than one month old, enter the age as follows: $\frac{0}{12}$.



Accuracy of returns. –The summary results of tabulating the answers to these questions for the negro population of continental United States are found in Table XXIX.

TABLE XXIX.—*Negro population, classified by age periods: 1900.*

QUINQUENNIAL AGE PERIOD.	Negro population: 1900.	QUINQUENNIAL AGE PERIOD.	Negro population: 1900.
Continental United States:		50 to 54 years	220,987
All ages	8,833,994	55 to 59 years	179,176
		60 to 64 years	161,687
Under 5 years	1,215,655	65 to 69 years	102,671
5 to 9 years	1,202,758	70 to 74 years	72,382
10 to 14 years	1,091,990	75 to 79 years	40,420
15 to 19 years	982,022	80 to 84 years	25,527
20 to 24 years	969,172	85 to 89 years	10,083
25 to 29 years	737,479	90 to 94 years	5,293
30 to 34 years	524,607	95 to 99 years	2,434
35 to 39 years	474,687	100 years and over	2,553
40 to 44 years	367,216	Age unknown	48,811
45 to 49 years	326,384		

Examination of the preceding table shows that in each five-year period, from birth to the end of life, the number of negroes living was less than in any preceding period. This is a uniform characteristic of population groups which are maintained almost entirely by excess of births over deaths, or as it is called, by natural increase. It does not hold true for a population maintained largely or entirely by immigration, like the foreign born population of the United States. Wherever in the United States it does not hold true for the negroes, one may infer with confidence that there the race is maintained largely by immigration from other states and territories. For example, the fact that there were reported in Pennsylvania 12,037 negroes between 10 and 14, 14,441 between 15 and 19, and 21,178 between 20 and 24 years, is evidence that the negro population of that state was drawn largely from other states.

DIAGRAM 5.—NUMBER OF NEGROES REPORTED AT EACH YEAR OF AGE: 1900.

While the negro population of the United States when distributed as in Table XXIX shows the regular decline already mentioned, the same is not true of the population by individual years. For example, the negroes reported as 59 years of age were 26,660, those reported as 61 were 13,696, while those reported as 60 were 92,756.[1] In other words, there were more than twice as many reported at 60 years of age as were reported at 59 and 61 combined. It is obvious that these figures are so contrary to all the probabilities that they must be deemed inaccurate. More careful inspection of the figures will show a uniform tendency up to about the age of 25 to report the age in multiples of 2, and a much more marked tendency from the age of 20 on to report the age in multiples of 5. The two tendencies apparently coexist through adult years, but the tendency to count age in multiples of 5 is so much more influential that it frequently obscures the other. These irregu-

[1] Twelfth Census, Vol. II, Table XVI.

larities in the reported distribution of negroes through the successive years of life are clearly indicated in Diagram 5, page 209, in which each unit of horizontal distance represents 1 year of age, and each unit of vertical distance represents 25,000 persons. By these scales the number of persons reported at each year of age is fixed at a point, the distance of which from the left-hand border indicates the year of age, and the distance from the base indicates the number of negroes at that age in continental United States. After the several points have been ascertained those for each two successive years have been connected by an irregular line.

It is uniformly found that the irregularity of the curve of reported ages is greatest in classes of the population in which illiteracy is prevalent and in which the results of census inquiries are exposed to a wide margin of error. It will be found of interest to compare the accuracy of the age reports from the negroes in different states and territories, and thereby to get some indication not merely of the trustworthiness of the answers in this field, but also of the accuracy with which other branches of the census work among the negroes was done.

A convenient measure of the inaccuracy of the answers to the age question may be found in the following way: It is fair to assume that the true number of negroes 30 years of age in a given state or territory was about one-fifth of the reported number at 28, 29, 30, 31, and 32 years of age. The same method would enable one to get an estimated true number of the negroes 35, 40, 45, 50, 55, and 60 years of age. In other words, the true number of negroes at these multiples of 5 was probably about one-fifth of the total number reported between 28 and 62 years of age, inclusive. The reported number at these multiples of 5 minus the estimated true number represents the estimated number of adults between 28 and 62 years of age who erroneously reported their age at some multiple of 5. On dividing this number by the total number of negroes between 28 and 62 years, inclusive, one finds the estimated number of erroneous reports in each 100 of the negro population between these ages. The results of this process for 1890 and for 1900 are given in the following table, in which the figures are given for the negroes in 1900, and the negroes, Indians, and Mongolians or non-Caucasians in 1890, the tabulation of ages in 1890 not having been made for the negroes. This difference is of little importance outside the Western division, and accordingly the figures for that division have been omitted from the table. In 1890 the general enumeration did not include Indian Territory and the Indian reservations.

TABLE XXX.—*Measure of concentration on multiples of 5 in age returns of negro population, 1900, and of negro, Indian, and Mongolian population, 1890.*

STATE OR TERRITORY.	PER CENT OF POPULATION, AGE 28 TO 62 YEARS, ESTIMATED TO HAVE REPORTED AGE ERRONEOUSLY AT MULTIPLES OF 5.	
	Negro population: 1900.	Negro, Indian, and Mongolian population: 1890.
Continental United States	16.2	19.5
North Atlantic division	9.0	13.2
New England	8.2	11.8
Maine	6.3	10.5
New Hampshire	4.0	12.4
Vermont	8.3	10.8
Massachusetts	7.7	11.5
Rhode Island	10.3	12.1
Connecticut	8.4	12.3
Southern North Atlantic	9.1	13.5
New York	8.9	13.3
New Jersey	9.5	15.3
Pennsylvania	9.1	13.0
South Atlantic division	18.6	21.1
Northern South Atlantic	17.7	20.3
Delaware	12.8	14.8
Maryland	15.3	18.7
District of Columbia	15.2	14.4
Virginia	19.9	22.3
West Virginia	11.3	17.0
Southern South Atlantic	19.1	21.5
North Carolina	15.6	19.1
South Carolina	21.4	21.1
Georgia	20.3	23.7
Florida	16.0	19.5
North Central division	8.0	11.9
Eastern North Central	7.1	10.9
Ohio	6.4	10.0
Indiana	6.5	10.3
Illinois	8.5	12.5
Michigan	4.8	11.1
Wisconsin	6.3	12.2
Western North Central	9.1	12.9
Minnesota	6.5	13.0
Iowa	6.9	11.3
Missouri	10.1	14.3
North Dakota	5.5	14.2
South Dakota	16.0	10.7
Nebraska	6.9	7.6
Kansas	6.9	10.7
South Central division	16.6	19.9
Eastern South Central	17.4	20.5
Kentucky	14.2	18.2
Tennessee	15.3	18.6
Alabama	18.2	21.6
Mississippi	19.0	21.6
Western South Central	15.4	18.9
Louisiana	17.3	20.5
Arkansas	14.1	16.7
Indian Territory	12.9	.....
Oklahoma	9.3	11.5
Texas	14.5	18.6

Inspection of the preceding figures shows that there has been an improvement during the ten years in the accuracy with which the ages of the negroes were reported, and that this improvement extends to every main and minor division and to every state and territory except District of Columbia, South Carolina, and South Dakota. The table shows also that in 1900 the greatest inaccuracies were found in the South Atlantic division, closely followed by the South Central, while the errors on the part of the negroes in the Northern states were only about half as numerous. In 1890 the states in which at least one-fifth of the negro population between 28 and 62 years, inclusive, reported their age erroneously were Virginia, South Carolina, Georgia, Alabama, Mississippi, and Louisiana. In 1900 there were only 2 such states, South Carolina and Georgia.

In the absence of conflicting evidence one is warranted in inferring from these facts that in other respects, as well as in the matter of age, the census statistics of the negroes in 1900 were probably more accurate than those in 1890, and at both dates the answers of negroes residing in the North were more accurate on the average than those in the South.

Median age.—A simple and convenient abbreviation for the age of a large number of people, like the negroes of the United States or any state or territory, is what is called the median age—that is, the age such that half the members of the population group under consideration are younger and half are older. The median age of the negro population in continental United States in 1900 is found to be 19.4 years. That of the whites in 1900 was 23.4 years. The median age of the negroes was lowest in South Carolina where half the negroes were below 17 years of age. It was highest in Nevada where half of them were over 35 years of age, but as the total number of negroes in that state was only 134 this fact has little significance. In the following table the states having at least 1,000 negroes in the year specified are arranged in the order of increasing median age:

TABLE XXXI.—MEDIAN AGE OF NEGRO POPULATION, 1900, AND OF NEGRO, INDIAN, AND MONGOLIAN POPULATION, 1890 AND 1880.

STATE OR TERRITORY HAVING AT LEAST 1,000 NEGROES IN 1900.	Median age of negro population: 1900.	STATE OR TERRITORY HAVING AT LEAST 1,000 NEGROES IN 1890.[1]	Median age of negro, Indian, and Mongolian population: 1890.	STATE OR TERRITORY HAVING AT LEAST 1,000 NEGROES IN 1880.[2]	Median age of negro, Indian, and Mongolian population: 1880.
Continental United States	19.4	Continental United States	18.3	Continental United States	18.0

Washington	30.1	California	32.8		
Montana	30.5	Oregon	32.9		
Oregon	30.7				

[1] Except Indian Territory, the population of which was not returned by age.
[2] Except Indian Territory, the population of which was not enumerated.

In the preceding table the states with a median age far above the average are those in which a large part of the negroes are adult immigrants. It is probably correct to say also that in the few states with a median age below the average for the whole country, the negro population is maintained by an excess of births over deaths, and that the balance of migration is away from the state, leaving an excess of children. The rise of 1.4 years in the median age of negroes in continental United States between 1880 and 1900, probably points to some improvement in health and longevity, although it might be explained as a result merely of the decreased birth rate. Such a change would result in a smaller proportion of children, and that would cause the median age to rise, even if there were no decline in the death rate. This decreasing proportion of children is undeniable, and attention is called to it later,[1] but the evidence to be considered seems to indicate, although not to prove, that there has also been a slight decrease in the death rate since 1890.[2]

BIRTHPLACE.

Distribution of negroes born in the South Atlantic and South Central divisions.—At each census since 1850 the state, territory, or country in which the person was born has been asked on the population schedule. In 1850 and 1860 this was asked only of the free inhabitants, and in 1870 the omissions among the southern negroes diminish the value of the figures. Attention will be confined here to the figures for 1900 and 1890.

These figures, like all those dealing with a current of migration, may be studied from either of two different standpoints—the source or the destination, immigration or emigration. One may trace the distribution of the negroes born in a given state or division over the other states or divisions, or one may analyze the negro population of a given state or division, and find how largely it is composed of individuals born in the state of residence and how largely of immigrants.

In this discussion the first method alone has been employed and the analysis confined to the negroes, Indians, and Mongolians, and the whites born in the Southern states. The figures for the negroes were tabulated separate from those for Indians and Mongolians only in 1900.

The negro, Indian, and Mongolian and the white natives of the South Atlantic states were distributed over the country in 1900 and 1890 as follows:

TABLE XXXII.—*Per 10,000 distribution of the negro, Indian, and Mongolian and the white population born in the South Atlantic division, by division of residence: 1900 and 1890.*

DIVISION OF RESIDENCE.	PER 10,000 DISTRIBUTION OF THE POPULATION BORN IN THE SOUTH ATLANTIC DIVISION, BY DIVISION OF RESIDENCE.			
	Negro, Indian, and Mongolian.		White.	
	1900	1890	1900	1890
Continental United States	10,000	10,000	10,000	10,000
North Atlantic division	404	247	238	197
New England	52	36	20	17
Southern North Atlantic	352	211	218	180
South Atlantic division	8,913	8,887	8,687	8,518
Northern South Atlantic	2,522	2,693	4,229	4,201
Southern South Atlantic	6,391	6,194	4,458	4,317
North Central division	109	120	398	519
Eastern North Central	75	77	219	267
Western North Central	34	43	179	252
South Central division	560	732	597	685
Eastern South Central	326	410	316	388
Western South Central	234	322	281	297
Western division	14	14	80	81
Rocky Mountain	5	5	29	28
Basin and Plateau	2	2	6	6
Pacific	7	7	45	47

The preceding table shows that the non-Caucasian natives of the South Atlantic states were found living in that division a little more generally in 1900 than in 1890. That is, of 10,000 non-Caucasian natives of that section living in continental United States, there were 26 more in 1900 than in 1890 living in the South Atlantic states. The table shows also that the non-Caucasian natives of that section remain in it in a larger proportion than do the whites, a difference naturally connected with their inferior economic position. It may be noted, however, that the change in the two races has been in the same direction, but that the whites have changed much more rapidly, so that of 10,000 whites born in the South Atlantic division 169 more were living there in 1900 than in 1890. Or the same fact may be expressed as follows: In 1890 the number of non-Caucasians residing in the South Atlantic division among every 10,000 born in that division exceeded the number of whites residing in that division among every 10,000 born in it by 369. In 1900 the difference had fallen to 226, that is, about two-fifths of the difference had disappeared.

In each of the other main and minor divisions, except the North Atlantic, the proportion for each race declined or remained practically unchanged.

[1] Pages 239–241. [2] Pages 237–239.

The migration of both races to the North Atlantic division increased, but the increase among the non-Caucasians was decidedly greater than among the whites, the increase being 41 in 10,000 among the whites and 157 among the non-Caucasians. The following table gives the same figures regarding the population of the South Central division:

TABLE XXXIII.—*Per 10,000 distribution of the negro, Indian, and Mongolian and the white population born in the South Central division, by division of residence: 1900 and 1890.*

DIVISION OF RESIDENCE.	PER 10,000 DISTRIBUTION OF THE POPULATION BORN IN THE SOUTH CENTRAL DIVISION, BY DIVISION OF RESIDENCE.			
	Negro, Indian, and Mongolian.		White.	
	1900	1890	1900	1890
Continental United States	10,000	10,000	10,000	10,000
North Atlantic division	14	9	32	25
New England	2	2	5	4
Southern North Atlantic	12	7	27	21
South Atlantic division	73	59	117	100
Northern South Atlantic	10	7	37	27
Southern South Atlantic	63	52	80	73
North Central division	287	289	535	660
Eastern North Central	174	155	238	264
Western North Central	113	134	297	396
South Central division	9,607	9,627	9,188	9,088
Eastern South Central	5,667	5,932	5,043	5,502
Western South Central	3,940	3,695	4,145	3,586
Western division	19	16	128	127
Rocky Mountain	9	8	48	43
Basin and Plateau	2	1	13	9
Pacific	8	7	67	75

The above table shows that a larger proportion of each class of natives of the South Central division has remained there than is true of the South Atlantic division, this being due in part to the larger area included in the South Central division and the weaker motives to migrate westward, and in part also to the lower average age of the natives of that rapidly growing region. One notices that here, too, the proportion of non-Caucasians, native of the section, who have remained there is decidedly greater than that of whites. The proportion for whites has increased by 100 in the 10,000 in ten years, while the proportion for non-Caucasians has decreased by 20, showing here also a tendency to greater agreement between the two classes, the difference in 1890 being 539, while in 1900 it was 419. The migration of non-Caucasians from the South Central to the Southern North Atlantic, the two South Atlantic, the Eastern North Central, and the three Western divisions has increased in ten years, and that of the whites has increased to all the Atlantic divisions and to the Rocky Mountain and Basin and Plateau divisions.

The migration of negroes born in the South to the North is roughly measured by the following figures:

CENSUS.	NON-CAUCASIAN NATIVES OF THE SOUTH RESIDING—		Per cent of non-Caucasian natives of the South in the North.
	In continental United States.	In North Atlantic and North Central divisions.	
1900	8,287,081	336,879	4.1
1890	6,915,715	230,931	3.3
Per cent of increase	19.8	45.9	

The negroes of southern birth living in the North increased more than twice as fast as the negro population of the country. In consequence, in 1890 about one-thirtieth of southern born negroes were living in the North; in 1900 nearly one twenty-fourth were in the North.

Whether this northward movement was peculiar to the negroes, or extended also to the southern born whites, appears from the following summary:

CENSUS.	WHITE NATIVES OF THE SOUTH RESIDING—		Per cent of white natives of the South in the North.
	In continental United States.	In North Atlantic and North Central divisions.	
1900	16,055,045	958,974	6.0
1890	12,921,995	904,689	7.0
Per cent of increase	24.2	6.0	

While there was a slight increase between 1890 and 1900 in the number of whites of southern birth and northern residence, it was less than one-fourth as rapid as the growth of the white population. The figures show that the northward migration of southern born negroes is going on faster than that of the southern born whites. The facts may be put in this way: In 1890 one-fifth (20.3 per cent) of the natives of the South living in the North were negroes; in 1900 the proportion had risen to more than one-fourth (26.0 per cent).

These figures seem to show that the migration of negroes from the South is increasing both absolutely and relatively, while that of the whites from the South is increasing absolutely, but decreasing relatively.

Table LXXXIII, of this section, shows the proportion of the negro residents of each state, territory, and division, who were born within and without the state or territory of residence, in 1900. The negroes of South Carolina have received relatively fewest reinforcements from the negroes of other states, less than one in fifty of the negro residents of that state having been born

beyond its bounds. The states in which less than one-tenth of the resident negro population was born outside of the state were as follows:

STATE.	Per cent.
South Carolina	1.8
North Carolina	4.2
Virginia	5.2
Georgia	7.2
Kentucky	8.4
Alabama	8.8

On the other hand, in every northern and western state, but Maine and Missouri, at least two-fifths of the resident negroes were born without the state. In the South this is true only of the negroes resident in the District of Columbia and West Virginia.

In Alaska nearly all the resident negroes were born elsewhere. The states and territories in which at least five-sixths of the resident negroes were immigrants were as follows:

STATE OR TERRITORY.	Per cent.
Alaska	96.3
Wyoming	89.1
Idaho	88.7
Arizona	84.9
Washington	84.9
Montana	84.0

All except Arizona lie in the extreme northwest, the region most remote from the negro habitat in the United States.

ILLITERACY.

Nature of inquiry.—In column 22 of the population schedule, headed "Can read," the enumerator was instructed to "write *Yes* for all persons 10 years of age and over who can *read* any language, and *No* for all other persons of that age who can not read in any language." In column 23, headed "Can write," the enumerator was instructed to "write *Yes* for all persons 10 years of age and over who can *write* any language, and *No* for all other persons of that age who can not write in any language." In this way the Bureau of the Census has sought to establish two grades of illiteracy. In the general usage of the Bureau, however, by an illiterate is meant one who can not write. In the following discussion the attempted subdivision of illiterates into those who can read and those who can not read will be ignored.

Accuracy of returns.—The enumerators accepted the statements made to them regarding literacy or illiteracy in the families they visited, and did not attempt to verify the answers by any test. Doubtless, on the part of many, there was unwillingness to admit their inability to read and write. In a certain number of cases this unwillingness must have gone so far as to induce false answers. The error from this source would be a biased error; that is, it would enroll a certain number of illiterates among those able to write, but would not enroll any able to write among the illiterates. Consequently, the figures regarding illiteracy must be accepted as a minimum limit of the true number, and may be several per cent in error. But no reason appears for believing that the proportion of errors would be much greater at one census than at another, and under the conditions the per cents of illiteracy at the successive censuses would not be materially wide of the truth for purposes of comparison.

Continental United States.—The prevalence of illiteracy in the two main races in 1900 and 1890 is indicated by the following table:

TABLE XXXIV. *Population at least 10 years of age and number and per cent illiterate, for the negro and white races: 1900 and 1890.*

RACE.	POPULATION AT LEAST 10 YEARS OF AGE.					
			Number illiterate.		Per cent illiterate.	
	1900	1890	1900	1890	1900	1890
Continental U. S.:						
Negro population	6,415,581	5,328,972	2,853,194	3,042,668	44.5	57.1
White population	51,250,918	41,931,074	3,200,746	3,212,574	6.2	7.7

At the present time, as well as in 1890, the per cent of illiteracy among the negroes of the country is more than seven times that among the whites.

But the public school system has developed so much further and has been in force so much longer in the North than in the South that illiteracy is far more prevalent among the white population in the South than it is among the white population of the entire country. Accordingly, a comparison between the two races in the Southern states may have more significance. The figures are as follows:

TABLE XXXV.—*Population at least 10 years of age and number and per cent illiterate, for the negro and white races in the South: 1900 and 1890.*

RACE.	POPULATION AT LEAST 10 YEARS OF AGE.					
			Number illiterate.		Per cent illiterate.	
	1900	1890	1900	1890	1900	1890
South Atlantic and South Central divisions:						
Negro population	5,664,975	4,751,763	2,717,606	2,883,216	48.0	60.7
White population	12,020,539	9,456,368	1,401,273	1,412,983	11.7	14.9

These figures show that illiteracy among southern negroes is more than four times that among southern whites.

With each race, illiteracy has decreased both in number and per cent and both for the country as a whole

and for the Southern states; and the decline has been at about the same rate, that is, with each race the number of illiterates to 1,000 persons at least 10 years of age in 1900 was rather less than four-fifths of what it was in 1890. If the per cent of illiterates in each race should be reduced by as great an amount in each future decade as it was in that from 1890 to 1900, an improbable contingency, it would fall to zero by 1940.

States and territories. The following table shows for 1900 and 1890 the per cent of negroes at least 10 years of age unable to write, for each state and territory which contained at least 500 negroes of that age in 1900. The states are arranged in the order of decreasing per cent illiterate in 1900, and the decrease in the per cent of illiterates during the ten years is shown in the last column:

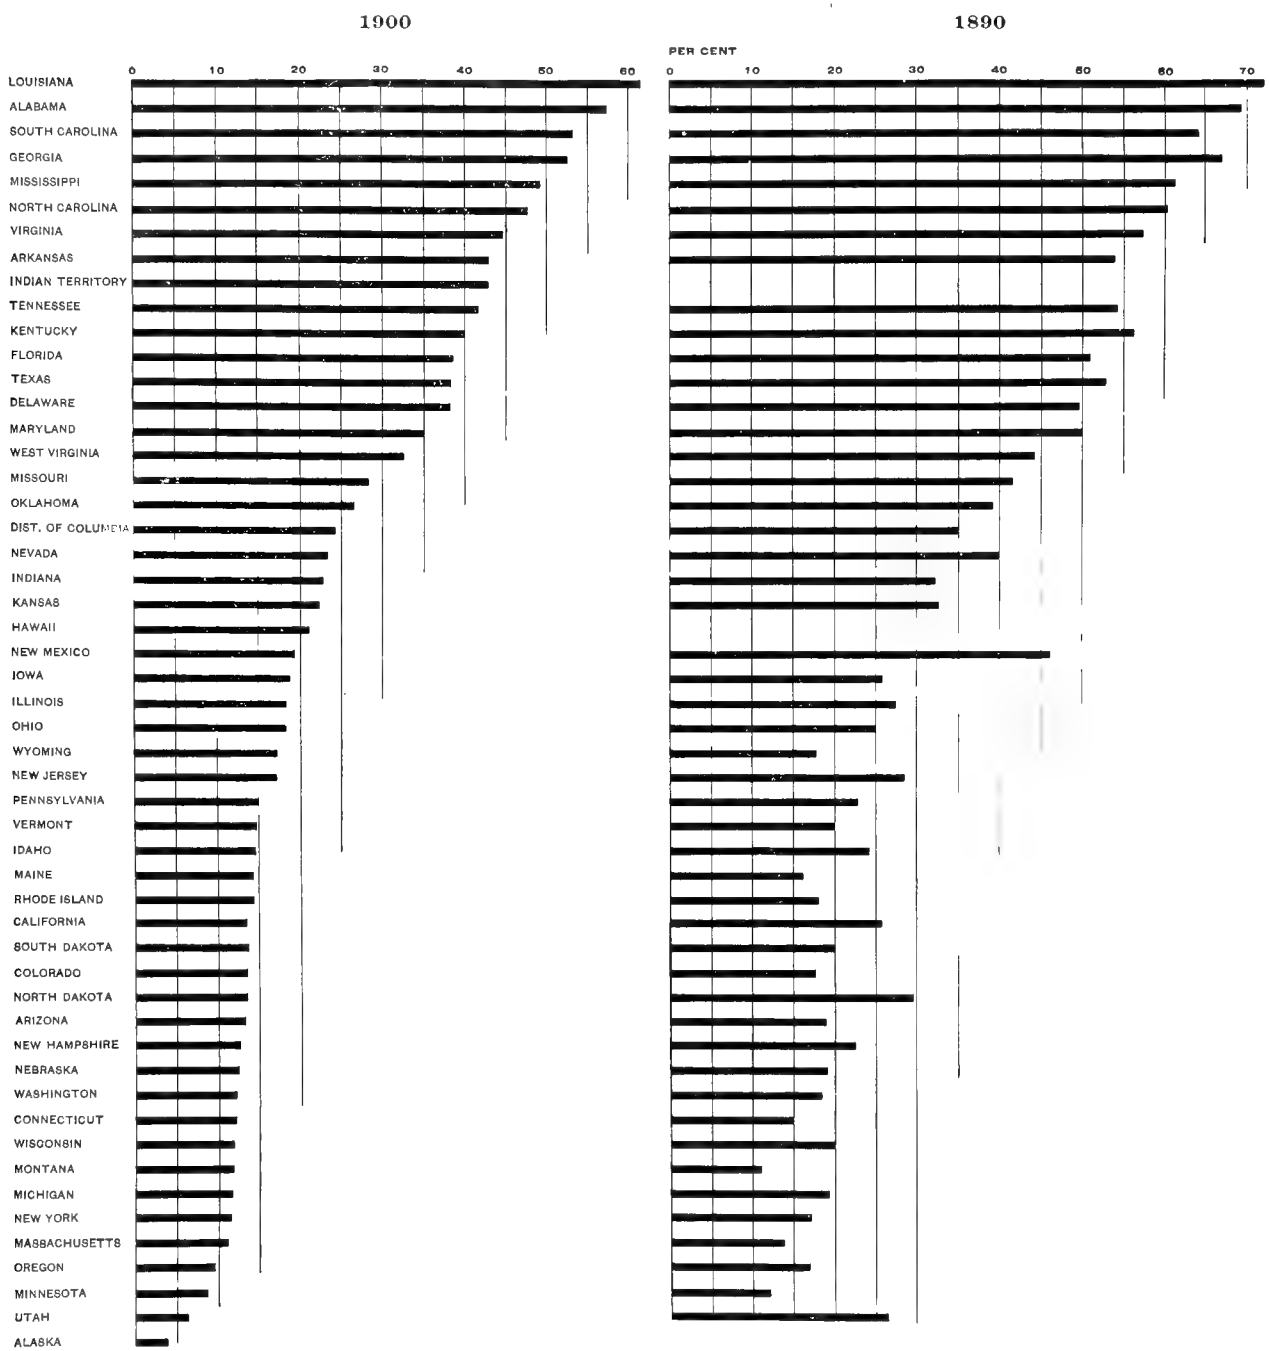
TABLE XXXVI.—*Per cent illiterate in negro population at least 10 years of age: 1900 and 1890.*

STATE OR TERRITORY HAVING AT LEAST 500 NEGROES 10 YEARS OF AGE AND OVER IN 1900.	PER CENT ILLITERATE IN NEGRO POPULATION AT LEAST 10 YEARS OF AGE.		Decrease in per cent illiterate: 1890 to 1900.
	1900	1890	
Louisiana	61.1	72.1	11.0
Alabama	57.4	69.1	11.7
South Carolina	52.8	64.1	11.3
Georgia	52.4	67.3	14.9
Mississippi	49.1	60.8	11.7
North Carolina	47.6	60.1	12.5
Virginia	44.6	57.2	12.6
Arkansas	43.0	53.6	10.6
Indian Territory	42.8	.....	.....
Tennessee	41.6	54.2	12.6
Kentucky	40.1	55.9	15.8
Florida	38.4	50.5	12.1
Texas	38.2	52.5	14.3
Delaware	38.1	49.5	11.4
Maryland	35.1	50.1	15.0
West Virginia	32.3	44.5	12.2
Missouri	28.1	41.7	13.6
Oklahoma	26.0	39.0	13.0
District of Columbia	24.3	35.0	10.7
Indiana	22.6	32.3	9.7
Kansas	22.3	32.8	10.5
New Mexico	19.1	45.8	26.7
Iowa	18.5	26.1	7.6
Illinois	18.1	26.8	8.7
Ohio	17.8	25.4	7.6
New Jersey	17.2	28.1	10.9
Wyoming	17.2	17.8	0.6
Pennsylvania	15.1	23.2	8.1
Vermont	14.6	20.4	5.8
Maine	14.2	15.9	1.7
Rhode Island	14.1	18.1	4.0
California	13.4	26.5	13.1
Colorado	13.0	17.6	4.6
Arizona	12.7	19.2	6.5
New Hampshire	11.9	22.5	10.6
Nebraska	11.8	19.1	7.3
Washington	11.6	17.7	6.1
Connecticut	11.5	15.3	3.8
Montana	11.4	11.0	[1]0.4
Wisconsin	11.4	20.0	8.6
Michigan	10.9	18.9	8.0
New York	10.8	17.1	6.3
Massachusetts	10.7	14.3	3.6
Oregon	8.8	17.1	8.3
Minnesota	7.9	12.1	4.2
Utah	6.3	26.6	20.3

[1] Increase.

The above table shows that illiteracy among negroes has decreased since 1890 in every state and territory with the insignificant exception of Montana. Every Southern state shows a decrease of at least 10 in the per cent illiterate. In every Northern and Western state, with a few unimportant exceptions, the per cent in 1900 is less than three-fourths what it was in 1890. The figures of Table XXXVI are shown graphically on Diagram 6, page 216.

Counties.—On examination of Table LXXXVIII of this section it is found that there are 352 counties in which one-half the negro population at least 10 years of age was illiterate in 1900. With the exception of New Madrid county, Mo., all these counties are in the South, 182, or more than half, being in the three states of Georgia, Alabama, and Louisiana. There are 96 counties with at least three-fifths of the negro population illiterate, 33 being in Louisiana, 27 in Georgia, 20 in Alabama, 6 in South Carolina, 4 in Mississippi, and the remaining 6 in Tennessee, Kentucky, Virginia, North Carolina, and Texas. The 30 counties in which over two-thirds of the negroes were illiterate in 1900 are shown in the following table:



COUNTY IN ORDER OF DECREASING PER CENT ILLITERATE.	Per cent illiterate in negro population at least 10 years of age: 1900.	COUNTY IN ORDER OF DECREASING PER CENT ILLITERATE.	Per cent illiterate in negro population at least 10 years of age: 1900.
Lafayette, La	85.9	Natchitoches, La	70.7
Concordia, La	81.4	Ouachita, La	70.2
St. Landry, La	81.3	Marengo, Ala	69.8
St. Martin, La	81.2	De Soto, La	69.1
Red River, La	76.9	Tensas, La	69.1
Vermilion, La	73.9	West Feliciana, La	69.1
Morgan, Tenn	73.4	Iberville, La	67.8
East Feliciana, La	73.1	Bossier, La	67.7
Pointe Coupee, La	72.6	Lowndes, Ala	67.7
Acadia, La	72.2	Wilkes, Ga	67.7
St. Helena, La	71.6	Morehouse, La	67.5
Franklin, La	71.5	Knott, Ky	67.3
Grant, La	71.1	Pickens, Ala	67.0
Miller, Ga	71.0	Colleton, S. C	66.9
Lincoln, Ga	70.9	Madison, La	66.8

Of the 30 counties with at least two-thirds of the negroes illiterate, Louisiana has 21, Alabama and Georgia have 3 each, and Kentucky, South Carolina, and Tennessee have 1 each.

City and country. In studying illiteracy the population limit between city and country must be drawn at 25,000 instead of at 2,500, since the number of illiterates is reported only for cities of that size. The prevalence of illiteracy in the two main races in city and country, in 1900, is shown by the following table:

	POPULATION AT LEAST 10 YEARS OF AGE: 1900.					
	Negro.	White.	Number illiterate.		Per cent illiterate.	
			Negro.	White.	Negro.	White.
Continental U.S.	6,415,581	51,250,918	2,853,194	3,200,746	44.5	6.2
Cities having at least 25,000 inhabitants	945,710	14,677,484	230,698	651,147	24.4	4.4
Smaller cities or country districts	5,469,871	36,573,434	2,622,496	2,549,599	47.9	7.0

DIAGRAM 6.—PER CENT ILLITERATE IN NEGRO POPULATION AT LEAST 10 YEARS OF AGE: 1900 AND 1890.

Illiteracy is almost twice as prevalent among negroes in country districts as it is in cities having at least 25,000 inhabitants, and the difference between city and country among whites is almost equally great. But as nearly half (48 per cent) of the negroes in the North and West live in cities of 25,000 inhabitants or more, a

comparison of conditions in the South alone may be more significant. The figures are as follows:

	POPULATION AT LEAST 10 YEARS OF AGE: 1900.					
			Number illiterate.		Per cent illiterate.	
	Negro.	White.	Negro.	White.	Negro.	White.
South Atlantic and South Central divisions	5,664,975	12,020,539	2,717,606	1,401,273	48.0	11.7
Cities having at least 25,000 inhabitants	572,924	1,429,546	180,357	47,482	31.5	3.3
Smaller cities or country districts	5,092,051	10,590,993	2,537,249	1,353,791	49.8	12.8

The per cent illiterate among southern negroes residing outside the large cities is much greater than the per cent in the cities, but the difference between city and country is less marked, relatively, for the negro than for the white population. For whites, the per cent illiterate in the country districts is nearly four times as great as that in the cities, while for negroes the per cent illiterate in the country is much less than double that in cities. This indicates that in the South negroes have been affected less than whites by the better school facilities of cities, or by the greater need in urban centers of an ability to read and write.

The Eleventh Census reported negro, Indian, and Mongolian illiterates together for cities, but the per cent illiterate for the non-Caucasian population in 1890 may safely be compared with that for the negro population alone in 1900. The figures for each year in the following comparisons necessarily relate only to cities having at least 25,000 inhabitants at the census specified. For the sake of clearness, only the per cents are shown in the table which follows:

	NUMBER OF CITIES.		PER CENT ILLITERATE IN POPULATION AT LEAST 10 YEARS OF AGE.					
			Negro: 1900.	Negro, Indian, and Mongolian: 1890.	Decrease in ten years.	White.		Decrease in ten years.
	1900	1890				1900	1890	
Continental U. S.	.....	.....	44.5	56.8	12.3	6.2	7.7	1.5
Cities having at least 25,000 inhabitants	160	124	24.4	34.6	10.2	4.4	4.9	0.5
Smaller cities or country districts	.....	.....	47.9	60.0	12.1	7.0	8.6	1.6

The per cent illiterate was less in 1900 than in 1890 by about one-fifth of the initial per cent for each race in country districts, while in cities having at least 25,000 inhabitants the per cent illiterate diminished by nearly one-third for negroes, but by only one-tenth for whites. The figures for the South are shown in the following table:

	NUMBER OF CITIES.		PER CENT ILLITERATE IN POPULATION AT LEAST 10 YEARS OF AGE.					
			Negro: 1900.	Negro, Indian, and Mongolian: 1890.	Decrease in ten years.	White.		Decrease in ten years.
	1900	1890				1900	1890	
South Atlantic and South Central divisions	.....	.....	48.0	60.7	12.7	11.7	14.9	3.2
Cities having at least 25,000 inhabitants	29	23	31.5	42.3	10.8	3.3	4.4	1.1
Smaller cities or country districts	.....	.....	49.8	62.5	12.7	12.8	16.3	3.5

Both tables show that illiteracy among negroes either in the country as a whole or in the South is less prevalent in cities than in country districts. They show also that the decrease in the per cent illiterate has been greater in the country districts. In 1890 among 1,000 non-Caucasian residents of southern cities, at least 10 years of age, there were 202 more who were able to write than among an equal number living in the country. For negroes in 1900 the corresponding difference between city and country was 183.

The per cent illiterate among negroes in the several cities will be found in Table LXXXVII of this section. In 1900 the per cent was greatest for the following 11 cities: Montgomery (46), Mobile (44.1), Birmingham (40.3), Augusta (38.8), Norfolk (38.5), New Orleans (36.1), Atlanta (35.1), Memphis (35.1), Savannah (34.1), Lexington (34), and Covington (33.8). These are the only cities in the country with at least one-third of the negroes illiterate.

Sex.—The following figures show for continental United States the number and per cent of illiterates among negroes and whites with distinction of sex:

TABLE XXXVII.—*Population at least 10 years of age by sex, and number and per cent illiterate, for the negro and white races: 1900 and 1890.*

RACE AND SEX.	POPULATION AT LEAST 10 YEARS OF AGE.					
			Number illiterate.		Per cent illiterate.	
	1900	1890	1900	1890	1900	1890
Continental U. S.						
Negro—						
Male	3,181,650	2,646,171	1,371,432	1,438,923	43.1	54.4
Female	3,233,931	2,682,801	1,481,762	1,603,745	45.8	59.8
White—						
Male	26,327,931	21,578,245	1,567,153	1,517,722	6.0	7.0
Female	24,922,987	20,352,829	1,633,593	1,694,852	6.6	8.3

The preceding figures show that in each race the female is the more illiterate sex. They show also that in each race this difference between the sexes is decreasing. Among the negroes the difference in the per cent illiterate for the two sexes was 5.4 in 1890 and 2.7 in 1900; among the whites it was 1.3 in 1890 and 0.6 in 1900, indicating that the difference is likely to disappear with another decade of progress like the last.

The inferences already stated are borne out by the figures for the Southern states given in the following table:

TABLE XXXVIII.—*Population at least 10 years of age by sex, and number and per cent illiterate, for the negro and white races in the South: 1900 and 1890.*

RACE AND SEX.	POPULATION AT LEAST 10 YEARS OF AGE.		Number illiterate.		Per cent illiterate.	
	1900	1890	1900	1890	1900	1890
South Atlantic and South Central divisions:						
Negro—						
Male	2,799,434	2,349,113	1,306,309	1,362,219	46.7	58.0
Female	2,865,541	2,402,650	1,411,297	1,520,997	49.3	63.3
White—						
Male	6,146,438	4,802,579	695,080	660,027	11.3	13.7
Female	5,874,101	4,653,789	706,193	752,956	12.0	16.2

Age.—The following table gives the number and per cent of negro and of white illiterates at certain age periods for continental United States:

TABLE XXXIX.—*Population by age periods and number and per cent illiterate, for the negro and white races: 1900.*

AGE PERIOD.	POPULATION AT LEAST 10 YEARS OF AGE: 1900.		Number illiterate.		Per cent illiterate.	
	Negro.	White.	Negro.	White.	Negro.	White.
Continental U. S.:						
10 years and over	6,415,581	51,250,918	2,853,194	3,200,746	44.5	6.2
10 to 14 years	1,091,990	6,959,238	328,992	240,580	30.1	3.5
15 to 17 years	590,694	3,976,066	185,196	148,594	31.4	3.7
18 to 20 years	613,745	3,868,317	207,978	167,332	33.9	4.3
21 to 24 years	746,755	5,033,850	259,436	232,249	34.7	4.6
25 to 34 years	1,262,086	10,767,424	496,180	583,293	39.3	5.4
35 to 44 years	841,903	8,312,718	437,503	569,819	52.0	6.9
45 to 54 years	617,371	5,739,659	420,438	501,571	68.1	8.7
55 to 64 years	340,863	3,641,875	267,312	362,297	78.4	9.9
65 years and over	261,363	2,806,719	223,124	378,071	85.4	13.5
Age unknown	48,811	145,052	27,035	16,940	55.4	11.7

The preceding table shows that for each race the higher the age limits of the group the larger the per cent illiterate. This must be due to the increase of facilities for education during recent years. If a person does not learn to write before reaching the age of 20, it is not likely that he will ever learn. The preceding series of figures then indicate with some clearness the facilities for education open to the negroes at successive periods. The most marked decrease of illiteracy occurs between the groups 25 to 34 (39.3 per cent), 35 to 44 (52 per cent), and 45 to 54 years (68.1 per cent). The oldest group must have been between 10 and 20 years of age at the close of the war and many of them were too old to profit by the reorganization of education in the South which began some years later and has developed until the present time. If the educational facilities in the country should remain up to their present standards, but not improve, and should impart the elements of education to as large a proportion of the rising generation as they have done to those between 10 and 14 years in 1900, then at the end of the generation, illiteracy among the negroes in the country will have sunk from 44.5 to 30.1 per cent, that is, nearly one-third of it will have disappeared. At the same time illiteracy among the whites in the country will have sunk, immigration aside, from 6.2 to 3.5 per cent, that is, about three-sevenths of the illiteracy among the whites will have disappeared.

In this, as in other topics, the statistics of the South differ so much from those of the North and West that a truer picture of the actual conditions is obtained when the two sections are treated separately.

TABLE XL.—*Population by age periods and number and per cent illiterate, for the negro and white races in the South: 1900.*

AGE PERIOD.	POPULATION AT LEAST 10 YEARS OF AGE: 1900.		Number illiterate.		Per cent illiterate.	
	Negro.	White.	Negro.	White.	Negro.	White.
South Atlantic and South Central divisions:						
10 years and over	5,664,975	12,020,539	2,717,666	1,401,273	48.0	11.7

65 years and over	232,217	531,149	205,101	111,277	88.3	20.9
Age unknown	41,466	34,477	24,015	6,845	57.9	19.9

TABLE XLI.—*Population by age periods and number and per cent illiterate, for the negro and white races in the North and West: 1900.*

AGE PERIOD.	POPULATION AT LEAST 10 YEARS OF AGE: 1900.		Number illiterate.		Per cent illiterate.	
	Negro.	White.	Negro.	White.	Negro.	White.
North Atlantic, North Central, and Western divisions:						
10 years and over	750,606	39,230,379	135,588	1,799,473	18.1	4.6
10 to 14 years	79,776	1,995,428	3,260	47,178	4.1	0.9
15 to 20 years	110,617	5,720,283	7,045	125,947	6.4	2.2
21 to 24 years	90,723	3,771,642	7,624	116,203	8.4	3.1
25 to 34 years	183,993	8,113,817	20,919	350,544	11.4	4.2
35 to 44 years	127,913	6,606,078	26,589	345,060	20.8	5.2
45 to 54 years	79,545	4,447,671	29,021	296,504	36.5	6.7
55 to 64 years	41,548	2,889,615	20,057	241,148	48.3	8.3
65 years and over	29,146	2,275,270	18,023	266,794	61.8	11.7
Age unknown	7,345	110,575	3,020	10,095	41.1	9.1

The first of the preceding tables shows that in the Southern states at the present time, among the children between 10 and 14 years of age, about one-tenth of the whites and one-third of the negroes are unable to write, and among persons at least 65 years of age one-fifth of the whites and nearly nine-tenths of the negroes are unable to write. The most marked transition appears with both races at about the age of 35. Persons below that age, or, in other words, persons of both races born in the South since 1865, are far more generally able to write than persons born prior to that date. At the present time nearly one-half of the negroes in the Southern states are unable to write. But if educational facilities for that race should remain about as they are at present for another generation, and be availed of to the same extent, the proportion would sink to one-third. A comparison between the two tables shows that illiteracy is far less prevalent among the northern and western negroes than it is among those at the South. This is especially true of the earlier age periods. At the North and West the proportion of negroes between 10 and 14 years of age who were unable to write is about one-eighth the proportion among southern negroes of the same age. When illiteracy at all ages is considered the proportion among negroes at the North and West is somewhat more than one-third of that at the South. At the same time the relative difference between negroes and whites in the two sections is approximately the same—that is, in each section of the country the illiteracy of the negroes at the present time is about four times that of the whites; in the North a little less, in the South a little more. Illiteracy among the youngest negroes at the South is about eight times that at the North and West, and is more than three times that of the whites at the South.

The following table gives the per cent of illiterates among the negroes by age periods for 1900 and 1890:

TABLE XLII.—*Per cent illiterate in negro population by age periods: 1900 and 1890.*

AGE PERIOD.	PER CENT ILLITERATE IN NEGRO POPULATION.		
	1900	1890	Decrease in ten years.
Continental United States:			
10 years and over	44.5	57.1	12.6
10 to 14 years	30.1	39.8	9.7
15 to 24 years	33.4	45.7	12.3
25 to 34 years	39.3	56.8	17.5
35 to 44 years	52.0	70.5	18.5
45 to 54 years	68.1	80.8	12.7
55 to 64 years	78.4	86.3	7.9
65 years and over	85.4	90.2	4.8

The preceding table shows that the proportion of illiterates has declined most rapidly for the age periods 25 to 34 and 35 to 44. By comparing the per cents for 1890 with the per cents for the population group 10 years older in 1900, one gets some clue to changes within a given group during the decade. For example, the group of negroes 25 to 34 years of age in 1900 should be substantially the survivors of the group 15 to 24 years of age in 1890, the additions from immigration and losses from emigration being insignificant. The death rate among the illiterates may have been somewhat higher than that among the literates, but it is doubtful whether this difference would seriously affect the per cent of illiteracy in the group as a whole. If it be disregarded, then the difference between the 45.7 per cent of illiterates in that group in 1890, and the 39.3 per cent of the group 10 years older in 1900, a difference of 6.4, indicates either the number of that age group who had learned to write in the ten-year period, or the number who were erroneously reported at one or the other census. The figures suggest that the process of acquiring the elements of education is not at an end by the time the age of 15 years is reached, but that, on the contrary, of the illiterate negroes between 15 and 24 years of age, about 1 in 7 learns to write in the course of the next ten years; that of those between 25 and 34 years of age, about 1 in 12 learns to write in the next ten years; that of those between 35 and 44 years of age, about 1 in 29 learns to write in the next ten years; and that of those between 45 and 54 years of age, about 1 in 34 learns to write in the next ten years. With the higher ages these estimates would probably be materially changed by the difference in the death rate of the literate and illiterate classes, and little confidence, at best, is to be attached to these estimates, owing to the probable error in the figures on which they are based. Still, the evidence they afford that the elements of education are frequently acquired as late in life as 25 years of age, and that the same happens occasionally but with less and less frequency at later years may probably be accepted.

MARITAL CONDITION.

Nature of inquiry.—Every negro in the United States should have been returned by the enumerator with one or another of the following entries written against his name in column 9 of the population schedule: S, indicating that the person was single or unmarried; M, indicating that the person was married; Wd, indicating that the person was widowed; or D, indicating that the person was divorced. Some enumerators, however, failed to make any entry, so that in the tabulation a fifth class of unknown became necessary. But as not more than 2 negroes in each 1,000 were so reported that class may be neglected. A similar tabulation was made for the census of 1890, but for no earlier census. In considering the statistics of marital condition it should be borne in mind that the Census Bureau has no means of checking or verifying the returns

of the enumerators. Unquestionably many negroes, who have never been united by a marriage ceremony, and many who, after a legal marriage, have separated and formed other and illegal unions, regarded and reported themselves as married to those with whom they were cohabiting at the date of the census. The following statements, while by no means typical of conditions all over the South, are undoubtedly true of a large proportion of negroes. "Legal marriage is not considered absolutely necessary. Of 40 couples who reported themselves as married . . . only 20 were legally married in the church or by the civil authorities. . . . Numerous cases are seen of two persons legally married and yet each living with a different person and reporting as being married to the second."[1]

Total population.—The results of the two enumerations of marital condition are briefly stated in Table XLIII.

TABLE XLIII.—NEGRO POPULATION AND WHITE POPULATION, CLASSIFIED BY MARITAL CONDITION, AND PER CENT DISTRIBUTION: 1900 AND 1890.

MARITAL CONDITION.	POPULATION.				PER CENT DISTRIBUTION.			
	Negro.		White.		Negro.		White.	
	1900	1890	1900	1890	1900	1890	1900	1890
Continental United States	8,833,994	7,470,040	66,809,196	54,983,890	100.0	100.0	100.0	100.0
Single	5,346,262	4,669,513	38,434,039	32,351,452	60.5	62.5	57.5	58.8
Married	2,867,572	2,363,231	24,779,046	19,918,836	32.5	31.7	37.1	36.2
Widowed	565,396	411,888	3,312,355	2,553,749	6.4	5.5	5.0	4.7
Divorced	33,071	15,907	164,520	104,960	0.4	0.2	0.2	0.2
Unknown	21,693	9,501	119,236	54,893	0.2	0.1	0.2	0.1

The preceding figures show that about three-fifths of the negroes are reported as single, nearly one-third as married, about one-sixteenth as widowed, and one two hundred and fiftieth as divorced. In the course of ten years the class of single has lost ground relatively and each of the other classes has gained. The negroes differ from the whites in having a larger proportion of single, widowed, and divorced, and a smaller proportion of married. The statistics of marital condition among southern whites may be different from the average for all whites, and in that case a comparison between the two races in the South would be more significant than one for the two races in the entire country. Table XLIV has therefore been prepared.

TABLE XLIV.—NEGRO POPULATION AND WHITE POPULATION, CLASSIFIED BY MARITAL CONDITION, AND PER CENT DISTRIBUTION, FOR THE SOUTH: 1900 AND 1890.

MARITAL CONDITION.	POPULATION				PER CENT DISTRIBUTION.			
	Negro.		White.		Negro.		White.	
	1900	1890	1900	1890	1900	1890	1900	1890
South Atlantic and South Central divisions	7,922,969	6,741,941	16,521,970	13,079,725	100.0	100.0	100.0	100.0
Single	4,846,846	4,250,262	10,006,749	8,112,564	61.2	63.1	60.6	62.0
Married	2,538,397	2,110,870	5,717,117	4,357,601	32.0	31.3	34.6	33.3
Widowed	491,643	359,220	747,522	581,710	6.2	5.3	4.5	4.5
Divorced	28,137	13,259	26,699	15,469	0.4	0.2	0.2	0.1
Unknown	17,946	8,330	23,883	12,381	0.2	0.1	0.1	0.1

The differences between southern negroes and southern whites in the statistics of marital condition are much less than those between all negroes and all whites. In the whole country 605 negroes per thousand and 575 whites per thousand are single, a difference between the races of 30. But in the South 612 negroes per thousand and 606 whites per thousand are single, a difference between the races of only 6. Similarly, in continental United States there are 46 more married whites than negroes per thousand, but for the Southern states the difference between the races is only 26.

Adult population.—The negro race has a much larger proportion of children than the white race, and a somewhat larger proportion than southern whites. Marriage is confined to adults, a period which is usually assumed in statistics of marriage to begin at the age of 15. To be sure, in continental United States 4,394 children under 15 years of age, over five-sixths of them girls, were reported as married, but this is an insignificant number in comparison with the 8,080,234 children

[1] Department of Labor, Bulletin 38, page 102 (January, 1902).

between 10 and 14 years of age. Accordingly it is necessary to exclude the children before one can be sure that marriage is less common among negroes than whites. This is done in the following table:

TABLE XLV.—NEGRO POPULATION AT LEAST 15 YEARS OF AGE AND WHITE POPULATION AT LEAST 15 YEARS OF AGE, CLASSIFIED BY MARITAL CONDITION, AND PER CENT DISTRIBUTION: 1900 AND 1890.

MARITAL CONDITION.	POPULATION AT LEAST 15 YEARS OF AGE.				PER CENT DISTRIBUTION.			
	Negro.		White.		Negro.		White.	
	1900	1890	1900	1890	1900	1890	1900	1890
Continental United States	5,323,591	4,295,271	44,291,680	35,939,102	100.0	100.0	100.0	100.0
Single	1,836,968	1,495,078	15,920,736	13,307,975	34.5	34.8	35.9	37.0
Married	2,866,703	2,362,947	24,775,625	19,917,695	53.9	55.0	55.9	55.4
Widowed	565,340	411,877	3,312,259	2,553,743	10.6	9.6	7.5	7.1
Divorced	33,059	15,900	164,498	104,954	0.6	0.4	0.4	0.3
Unknown	21,521	9,469	118,562	54,735	0.4	0.2	0.3	0.2

The preceding table shows that among 1,000 negroes at least 15 years of age, 345 are single and 539 are married, while among 1,000 whites of the same age, 14 more are single and 20 more are married, the total difference of 34 being almost balanced by the fact that among the negroes 31 more in each 1,000 are widowed than among the whites. The relatively short life of the negro population would lead one to expect a rather large number of this class, but the difference between the two races seems to be too great to be accounted for in that way. One is disposed to believe that no small number of the 565,340 negro widows or widowers were persons whose marital relations had been ended by separation rather than by death and whose marital condition, therefore, has been inaccurately described. It is noteworthy also that while there has been an increase on the part of each race in the reported number of divorced persons, that increase has been much greater among the negroes than among the whites. The number of divorced negroes in the decade has much more than doubled, while the number among the whites has increased about 60 per cent. While the proportion of married among the adults of the two races in 1890 was about the same, the proportion among the whites increased in ten years, while that among the negroes decreased, so that in 1900 among 1,000 whites at least 15 years of age, 20 more were married than among 1,000 negroes.

Here again fuller light upon the situation can be obtained when the comparison is limited to the negroes and whites of the South Atlantic and South Central states, as has been done in the following table:

TABLE XLVI.—NEGRO POPULATION AT LEAST 15 YEARS OF AGE AND WHITE POPULATION AT LEAST 15 YEARS OF AGE, CLASSIFIED BY MARITAL CONDITION, AND PER CENT DISTRIBUTION, FOR THE SOUTH: 1900 AND 1890.

MARITAL CONDITION.	POPULATION AT LEAST 15 YEARS OF AGE.				PER CENT DISTRIBUTION.			
	Negro.		White.		Negro.		White.	
	1900	1890	1900	1890	1900	1890	1900	1890
South Atlantic and South Central divisions	4,652,761	3,793,563	10,056,729	7,785,256	100.0	100.0	100.0	100.0
Single	1,577,678	1,302,198	3,542,776	2,818,915	33.9	34.3	35.3	36.2
Married	2,537,576	2,110,600	5,715,122	4,356,822	54.5	55.6	56.8	56.0
Widowed	491,589	359,209	747,471	581,707	10.6	9.5	7.4	7.5
Divorced	28,126	13,252	26,692	15,464	0.6	0.4	0.3	0.2
Unknown	17,792	8,304	23,668	12,348	0.4	0.2	0.2	0.1

Among 1,000 southern negroes at least 15 years of age the number of widowed exceeds by 32 the number of this class among 1,000 southern white adults, this difference being offset by an excess of 14 single and 23 married per thousand among the whites. This difference in the proportion married was only 4 in 1890, the proportion among the whites having increased by 8 and that among the negroes having decreased by 11 during the ten years.

Sex.—The relations become a little clearer when the distinction between the sexes is drawn.

Table LXXVII of this section shows that the number of negro husbands in continental United States was 1,423,039; the number of negro wives was 1,444,533; showing 21,494 more negro wives than husbands. In a monogamous country and migration aside, one would expect the total number of husbands and wives to be equal. The slight divergence in this case of 1.5 per cent is probably due not to the immigration of somewhat more negro wives than husbands, and not to the fact that more negro women are married to white men than white women to negro men. The latter statement may be correct, but the number of such unions between members of the different races is probably so small as

not materially to affect the total. A more probable explanation, at least, is that the difference results from inaccurate statements. In every great population there are rather more women than men who believe or allege that they are married.

The figures of marital condition for negroes are given in Table LXXVIII of this section, and those for whites may be obtained from the extended volumes of the Twelfth and Eleventh censuses. In the following table, for purposes of simplicity and clearness, only the per cents are given:

TABLE XLVII.—*Per cent distribution of population at least 15 years of age by marital condition, for the negro and white races by sex: 1900 and 1890.*

MARITAL CONDITION.	PER CENT DISTRIBUTION OF POPULATION AT LEAST 15 YEARS OF AGE BY MARITAL CONDITION.							
	Male.				Female.			
	Negro.		White.		Negro.		White.	
	1900	1890	1900	1890	1900	1890	1900	1890
Continental United States	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Single	39.2	39.8	40.2	41.7	29.9	30.0	31.4	32.0
Married	54.0	55.5	54.6	53.9	53.7	54.6	57.3	57.0
Widowed	5.8	4.3	4.5	3.9	15.4	14.7	10.7	10.5
Divorced	0.4	0.2	0.3	0.3	0.8	0.5	0.4	0.4
Unknown	0.6	0.2	0.4	0.2	0.2	0.2	0.2	0.1

The table shows that among negro men the number of single was less by 10 per thousand, and of married less by 6 per thousand than among the whites, the difference of 16 being counterbalanced mainly by an excess among negro widowers of 13 per thousand. Among negro women the number of single was less by 15 per thousand, and of married less by 36 than among white women, the difference of 51 being mainly counterbalanced by an excess of 47 per thousand in the class of negro widows. Whether one accepts these figures at their face value, or regards no small part of the difference as due to erroneous returns of marital condition among negroes, they reflect the brevity of married life among them, and the frequency with which the marital union comes to an end.

With both races and both sexes the proportion of single declined between 1890 and 1900, the decline being greatest (15 per thousand) among white men, and least (1 per thousand) among negro women. With both sexes of the negro race the proportion of married also declined in the ten years, the decline per thousand being, in the case of men 15 and in the case of women 9. Meantime, with both sexes of the white race, the proportion of married increased, the increase in the case of men being 7 per thousand and in the case of women 3 per thousand. As a result, the number of married negro men per thousand in 1900 was 6 less and of married negro women 36 less than the corresponding number of married white men and women.

As in previous instances the differences thus revealed between the negro and the white races for continental United States may be differences between the South and the North, rather than between the negro and the white. To ascertain whether or how far this is true, the per cents have been computed for the two races in the Southern states. The results are given in the following table, in which for the sake of brevity and clearness the per cents alone have been included:

TABLE XLVIII.—*Per cent distribution of population at least 15 years of age by marital condition, for the negro and white races by sex, for the South: 1900 and 1890.*

MARITAL CONDITION.	PER CENT DISTRIBUTION OF POPULATION AT LEAST 15 YEARS OF AGE BY MARITAL CONDITION.							
	Male.				Female.			
	Negro.		White.		Negro.		White.	
	1900	1890	1900	1890	1900	1890	1900	1890
South Atlantic and South Central divisions	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Single	38.4	39.1	39.6	40.7	29.5	29.8	30.7	31.5
Married	55.0	56.3	55.7	55.2	54.1	55.0	58.0	56.7
Widowed	5.7	4.2	4.2	3.7	15.3	14.5	10.8	11.4
Divorced	0.4	0.2	0.2	0.2	0.8	0.5	0.3	0.3
Unknown	0.5	0.2	0.3	0.2	0.3	0.2	0.2	0.1

The preceding table shows that for each race and sex there was a decrease in the proportion of single, the decrease for negroes being less than for whites. With regard to the married there was a marked relative decrease among negroes of both sexes, a decrease which was the more noteworthy because within the same period the proportion of married among southern whites of both sexes showed an increase. The decrease in the proportion of single and of married negroes is offset mainly by the increase in the proportion of negro widows and widowers. Among 1,000 negro men at least 15 years of age in 1890 there were 42 widowers, and in 1900, 57. Among 1,000 negro women at least 15 years of age in 1890 there were 145 widows, and in 1900, 153. During the same period the number of widowers among the southern whites increased 5 per thousand, or one-third as fast as among the negroes, and the number of widows decreased 6 per thousand. The proportion of divorced men among the negroes doubled and that of divorced women increased very rapidly. It may be easier to grasp the meaning of these figures if the classes of widowed and divorced be combined, the figures for unknown disregarded, and only the 3 classes, premarital, married, and postmarital distinguished as in the following summary:

	MALE NEGROES.		MALE WHITES.		FEMALE NEGROES.		FEMALE WHITES.	
	1900	1890	1900	1890	1900	1890	1900	1890
Premarital	384	391	396	407	295	298	307	315
Married	550	563	557	552	541	550	580	567
Postmarital	61	44	14	39	161	150	111	117

The decrease in the proportion of married negroes of both sexes at the South during a decade in which the proportion of married whites of both sexes increased is a noteworthy fact which will be referred to later (page 240) in connection with the proportion of children in the two races. The decrease in the proportion of white widows, contrary to the general tendency for the whole country, may be connected with the death of many whose husbands died during the Civil War.

Sex and age.—In order to ascertain the present condition of the negro population with reference to marriage and the changes which have occurred within the decade 1890 to 1900, the only one for which the information exists, it is necessary to take account also of age. For this purpose persons under 15 years of age may be excluded as not of marriageable age. The others are divided by the census tables into eight age periods, as in Table XLIX below. For the purpose of simplifying what is at best a somewhat complex tabulation the small number of persons of unknown marital condition have been grouped in the following tables with the single, the small number of divorced with the widowed, and per cents only have been given.

TABLE XLIX.—PER CENT DISTRIBUTION BY MARITAL CONDITION, FOR THE NEGRO POPULATION BY SEX AND AGE PERIODS: 1900 AND 1890.

AGE PERIOD.	PER CENT OF NEGRO MALE POPULATION—						PER CENT OF NEGRO FEMALE POPULATION—

[1] Less than one-tenth of 1 per cent.

The preceding table shows that with both male and female negroes the per cent of single and unknown and of married among adults declined in the ten years, while the per cent of widowed and divorced correspondingly increased. But this decline in the per cent of single for males is confined to the age periods between 15 and 24 and over 65, negro males between 25 and 64 being more generally single in 1900 than in 1890. The decrease in the per cent of single at the extremes of life has been great enough to produce a decline in the total, notwithstanding an increase in five of the eight age periods. With the females the slight decline in the per cent of single among total negroes over 15 years of age is due to a decided decline in the per cent single among girls 15 to 19 years of age. The per cent single among negro women at least 20 years of age was larger in 1900 than in 1890 for each age period, with an insignificant exception for 55 to 64 years. Among negro men at least 15 years of age there has been a decline in the per cent married, a decline which appeared at every age period except the first two, 15 to 19 and 20 to 24 years; the same is true of women except that increases in the per cent married appear for the age periods 15 to 19 and 55 to 64 years. The increase in the proportion of widowed and divorced for each sex is not due to any change in the age composition of the population. For among males of all ages and among females at every age below 55 the proportion of widowed and divorced has increased in the ten years.

It appears from this detailed analysis that the slight decline in the proportion of married persons among all negroes at least 15 years of age is due to a decline in the per cent married for each sex at substantially every age above 20 years, largely offset in the case of women and partly so in the case of men by an increase in early marriages, that is, among negroes 15 to 19 years of age. The latter change, which appears also among the whites, is probably a result of the unusual prosperity in the country immediately preceding the census of 1900. The former represents probably a more permanent tendency.

The preceding table can be better understood when the figures for whites are also considered. As nine-tenths of the negroes live in the Southern states, and as the marital condition among southern whites differs not a little from that among northern whites, the table introduced for comparison is one for whites in the Southern states rather than for all whites.

TABLE L.—PER CENT DISTRIBUTION BY MARITAL CONDITION, FOR THE WHITE POPULATION BY SEX AND AGE PERIODS, FOR THE SOUTH: 1900 AND 1890.

AGE PERIOD.	PER CENT OF WHITE MALE POPULATION—						PER CENT OF WHITE FEMALE POPULATION—					
	Single and unknown.		Married.		Widowed and divorced.		Single and unknown.		Married.		Widowed and divorced.

[1] Less than one-tenth of 1 per cent.

The table shows that among southern whites there has been a decline for both sexes in the per cent single and an increase in the per cent married, while the per cent widowed and divorced increased for the male and decreased for the female. The main difference between the two races, brought out by the two tables, is that among negroes there has been a slight decline, while among southern whites there has been a slight increase in the per cent married. In both races and for both sexes there has been an increase of early marriages. For males of both races an increase in the per cent married is shown for the early age periods 15 to 19 and 20 to 24 years, but for the later period the increase for whites is the more marked; in the age period, 25 to 29 years, the proportion of white men married was the same at each census while there was a decline among negroes. Up to the age of 30 the proportion of negro men married is greater than that of southern white men. But from 30 to 64 years the proportion of married among southern white men is greater than among the negro men. Marriages on the part of girls, 15 to 19 years of age, which were much more common among negroes than among whites in 1890, have increased in both races, but the increase among whites has been so much more rapid than among negroes that by 1900 the difference between the races had practically disappeared. This increase of early marriages among female negroes is confined to the first age period, 15 to 19, while among female southern whites it extends through the age period, 20 to 24 years, the difference between the races in the per cent married at that age period being 3.9 in 1890 and only 0.7 in 1900. At later ages there has been a decline in the proportion married on the part of males. The two races agree, then, in showing an increase in early marriages and for males a decline in the per cent married in later adult years; they differ in that the negroes show a decrease and the southern whites an increase in the per cent married among women in later adult years. As resultants of these two opposite movements the change among all adult negroes was in the direction of a slight decrease and among all adult southern whites in the direction of a slight increase in the per cent married.

The proportion of widowed and divorced is also very much higher among negroes than among southern whites of like ages. Indeed, among men in each age period from 20 to 34 years of age and among women 15 to 44 years of age the per cent of widowed and divorced for negroes is about twice as high as for whites. This is due in part to the higher mortality of negroes, discussed in the section on vital statistics, but probably even more to the more temporary character of the unions, that is, the higher mortality of negro marriages.

Attention has been frequently called in this discussion to the differences between the statistics of negroes in the South, where the population is maintained almost exclusively by excess of births over deaths, and negroes in the North, where the population is maintained largely by immigration from the South. In order to determine whether this difference has effect upon the marital statistics of negroes in the two sections, tables have been prepared for the negroes of the Southern states and for the negroes of the Northern and Western states. The results are as follows:

TABLE LI.—PER CENT DISTRIBUTION BY MARITAL CONDITION, FOR THE NEGRO POPULATION BY SEX AND AGE PERIODS, FOR THE SOUTH: 1900 AND 1890.

AGE PERIOD.	PER CENT OF NEGRO MALE POPULATION—						PER CENT OF NEGRO FEMALE POPULATION—					
	Single and unknown.		Married.		Widowed and divorced.		Single and unknown.		Married.		Widowed and divorced.

Age unknown	56.9	50.5	36.2	43.4	6.9	6.1	34.1	25.1	38.1	45.4	27.8	29.5

[1] Less than one-tenth of 1 per cent.

The tables show that for both sexes southern negroes are much more generally married than northern negroes, the difference between the two sections in 1900 in the per cent married being in the case of males 7.2, and in the case of females 3.8. That the difference between the sections for male negroes is nearly double that for female negroes is due at least in part to the fact that in the South, among 1,000 adult negroes, there are 16 more females than males, while in the North and West, among 1,000 adult negroes, there are 24 more males than females. The excess of males at the North reinforces for that sex and counteracts for the females, the other influences tending to a smaller proportion of married persons in that section. In the proportion of widowed and divorced there is little difference between the two sections, the larger proportion of married at the South being offset by a smaller proportion of single. In both sections the per cent married decreased in the course of the ten years. The increase of early marriages, to which attention has already been called, appears clearly in both sections. The figures show that the increase of early marriages among males extended through the age period, 20 to 24 years, both at the South and at the North and West.

Comparison of these tables indicates that the migration of negroes from the Southern states to the North and West, the current of which has probably been greater in the last ten years than heretofore, is a partial but not a complete explanation of the decrease in the proportion of married among negroes of both sexes.

BREADWINNERS.

Nature of inquiry.—Columns 19 and 20 of the population schedule were headed jointly "Occupation, trade, or profession of each person ten years of age and over." Column 19 then called for the occupation and column 20 for the months during the census year, namely, from June 1, 1899 to May 31, 1900, inclusive, during which the person was not employed. The instructions issued to the enumerators for filling this schedule called for a return for every person 10 years of age and over who was engaged in gainful labor during any part of the census year, or who was ordinarily so engaged, even though he had been unable to secure work during that

time. A brief name for this class being almost essential, the word "breadwinner"[1] has been applied to it throughout the following discussion.

The difficulties inherent in any satisfactory report and classification of occupations are accentuated where many members of the class from which the reports come are ignorant and unable or unwilling to state accurately the exact kind of work they do. Accordingly, the occupation returns for the negro population are less trustworthy than the average. It is true also that occupations are less differentiated among this class so largely occupied with agricultural industry or the simple forms of unskilled labor.

Occupations were tabulated for the separate races only at the censuses of 1890 and 1900, and it is therefore only for these two censuses that the figures are available.

Total number.—The following figures give a summary comparison between the number and proportion of whites and of negroes engaged in gainful or money-getting occupations in 1900 and 1890:

TABLE LIII.—*Population and number and per cent engaged in gainful occupations, for the negro and white races: 1900 and 1890.*

RACE.	POPULATION.		POPULATION AT LEAST 10 YEARS OF AGE ENGAGED IN GAINFUL OCCUPATIONS.		PER CENT OF POPULATION ENGAGED IN GAINFUL OCCUPATIONS.	
	1900	1890	1900	1890	1900	1890
Continental United States:						
Negro	8,833,994	7,470,040	3,992,337	3,073,164	45.2	41.1
White	66,809,196	54,983,890	24,913,071	19,542,188	37.3	35.5

The foregoing figures show that among every 1,000 negroes in continental United States, 452 are engaged in gainful occupations. The number so reported has sharply increased since 1890, when only 411 in 1,000 were breadwinners. The proportion among the negroes was much greater than among the whites, and while the proportion for both races has increased since 1890 the increase has been more marked among the negroes, so that the difference between the races in this respect has increased from 56 per thousand in 1890 to 79 per thousand in 1900.

In the following table the comparison between the two races has been limited to the Southern states, where the industrial conditions are somewhat more uniform than in the entire country:

TABLE LIV.—*Population and number and per cent engaged in gainful occupations, for the negro and white races in the South: 1900 and 1890.*

RACE.	POPULATION.		POPULATION AT LEAST 10 YEARS OF AGE ENGAGED IN GAINFUL OCCUPATIONS.		PER CENT OF POPULATION ENGAGED IN GAINFUL OCCUPATIONS.	
	1900	1890	1900	1890	1900	1890
South Atlantic and South Central divisions:						
Negro	7,922,969	6,741,941	3,544,749	2,746,084	44.7	40.7
White	16,521,970	13,079,725	5,642,865	4,003,426	34.2	30.6

The inferences already stated are not materially modified by limiting the comparison between the two races to the Southern states. The main difference is that for the South all the per cents are smaller than for the entire country. But this is preeminently true of the whites, so that in the South the difference between the races in 1890 was 101 in the thousand and in 1900, 105, the corresponding figures for the whole country being as already stated, 56 and 79. In the Southern states about 10 per cent more of the negroes than of the whites are reported as having some gainful occupation.

The proportion of children in the Southern states is much greater than in the country at large. In 1900 the per cent of the population of the South under 10 years of age was 27.7, while in the rest of the country it was 21.9, and in the whole country 23.7 (Twelfth Census, Abstract, Tables 50 and 51), showing in the South 6 more children to each 100 people than in the rest of the country. Now a child under 10 years of age is presumed by the census to be unoccupied, and in those very few cases in which an occupation was reported it was not tabulated. As 274 out of every 1,000 negroes and only 233 out of every 1,000 whites in the country are under 10 years of age (Twelfth Census, Abstract, Table 11), it is fairer to exclude this class in making the comparison between the races. This has been done in the following table:

TABLE LV.—*Population at least 10 years of age and number and per cent engaged in gainful occupations, for the negro and white races: 1900 and 1890.*

RACE.	POPULATION AT LEAST 10 YEARS OF AGE.					
	1900	1890	Number engaged in gainful occupations.		Per cent engaged in gainful occupations.	
			1900	1890	1900	1890
Continental United States:						
Negro	6,415,581	5,328,972	3,992,337	3,073,164	62.2	57.7
White	51,250,918	41,931,071	24,913,071	19,542,188	48.6	46.6

[1] The term *breadwinner* must be understood in a sense somewhat different from its usual one. It includes "every person 10 years of age and over who is at work, that is, occupied in gainful labor." It does not include a person "who has retired from practice or business; or a wife or daughter living at home and assisting only in the household duties without pay," nor does it include a person who does domestic errands or family chores out of school hours, but regularly attends school. On the other hand, "if a boy or girl, above 10 years of age, is earning money regularly by labor, contributing to the family support, or appreciably assisting in mechanical or agricultural industry," he should be included. The foregoing extracts from various parts of the pamphlet of "Instructions to Enumerators," sections 153 to 223, will make clearer the meaning attached to the word by the Bureau of the Census.

When children are excluded the difference between the races is accentuated. Less than half the whites, but five-eighths of the negroes, were reported as breadwinners and while the number of white breadwinners per thousand of population increased but 20 in the ten years, that of the negroes increased 45. In the following table similar comparisons are made between the two races for the South:

TABLE LVI.—*Population at least 10 years of age and number and per cent engaged in gainful occupations, for the negro and white races in the South: 1900 and 1890.*

RACE.	POPULATION AT LEAST 10 YEARS OF AGE.					
	1900	1890	Number engaged in gainful occupations.		Per cent engaged in gainful occupations.	
			1900	1890	1900	1890
South Atlantic and South Central divisions:						
Negro	5,664,975	4,751,763	3,544,749	2,746,084	62.6	57.8
White	12,020,539	9,456,368	5,642,865	4,003,426	46.9	42.3

The per cents for the negroes in the South differ but little from those for all negroes, but among whites in the South the per cent engaged in gainful occupations is noticeably less than for all whites, and in consequence the difference between the two races is increased when the figures for the North and West are excluded. The above table shows that the increase in the number of breadwinners among southern negroes has been a little more rapid than among southern whites. Of 1,000 southern negroes at least 10 years of age the number reported as having a gainful occupation in 1900 exceeded that in 1890 by 48; of 1,000 southern whites the number so reported in 1900 exceeded that in 1890 by 46. The proportion of southern whites engaged in gainful occupations has risen rapidly in the decade toward the proportion for all whites. In 1890 it was below the proportion for all whites by 43 per thousand; in 1900 it was below that proportion by only 17.

Sex.—The figures already given do not enable one to decide whether the larger proportion of negro breadwinners holds for each sex. Every one knows that agricultural labor and domestic service are much more entered by negro women than by white. The large number of female negroes at work might be so great as to cause the entire difference noted or even to overbalance a small excess of breadwinners among male whites. The following table gives the figures by sex:

TABLE LVII.—*Population at least 10 years of age by sex, and number and per cent engaged in gainful occupations, for the negro and white races: 1900 and 1890.*

RACE AND SEX.	POPULATION AT LEAST 10 YEARS OF AGE.					
	1900	1890	Number engaged in gainful occupations.		Per cent engaged in gainful occupations.	
			1900	1890	1900	1890
Continental United States:						
Negro—						
Male	3,181,650	2,646,171	2,675,497	2,101,379	84.1	79.4
Female	3,233,931	2,682,801	1,316,840	971,785	40.7	36.2
White—						
Male	26,327,931	21,578,245	20,923,178	16,603,147	79.5	76.9
Female	24,922,987	20,352,829	3,989,893	2,939,041	16.0	14.4

The foregoing figures show that in 1900 among 1,000 negro females at least 10 years of age 407 were reported as breadwinners. The corresponding number among white females was only 160. About 2 negro women out of 5 and 1 white woman out of 6 are breadwinners. Among males the difference between the two races in the per cent of breadwinners is 4.6; for both sexes together it is 13.6 (Table LV); that is, about two-thirds of the difference between the races is due to the very much larger proportion of negro women at work.

To ascertain whether the differences shown in the preceding table are materially affected by the industrial differences between the South and the North, the following table gives similar figures for the Southern states:

TABLE LVIII.—*Population at least 10 years of age by sex, and number and per cent engaged in gainful occupations, for the negro and white races in the South: 1900 and 1890.*

RACE AND SEX.	POPULATION AT LEAST 10 YEARS OF AGE.					
	1900	1890	Number engaged in gainful occupations.		Per cent engaged in gainful occupations.	
			1900	1890	1900	1890
South Atlantic and South Central divisions:						
Negro—						
Male	2,799,434	2,319,113	2,360,972	1,861,635	84.3	79.2
Female	2,865,541	2,427,650	1,183,777	884,449	41.3	36.8
White—						
Male	6,146,438	4,802,579	4,950,097	3,539,500	80.5	73.7
Female	5,874,101	4,653,789	692,768	463,926	11.8	10.0

As in the former case, the per cent of negro breadwinners, male and female, is little affected by excluding the North and West. In both races and for both sexes

there has been an increase in the relative number of breadwinners in the last decade. This increase among female whites, like that among male and female negroes, has gone on in the South at about the same rate as in the country as a whole. Money earning on the part of white girls and women is still, however, much less common in the South than in the North and West. Among every 1,000 female whites at least 10 years of age in the South 118 were reported as having a gainful occupation; in the North and West the number was 173, or 55 more. But the most marked change was among male whites in the South. Among each 1,000 of this class at least 10 years of age the number of reported breadwinners in 1900 was greater by 68 than it was in 1890, an increase so great that in 1900 the proportion of male white breadwinners in the South was greater than that for the North and West. Among males in the Southern states the difference between the two races in the per cent of breadwinners is 3.8; for both sexes together it is 15.7 (Table LVI); that is, about three-fourths of the difference between the two races in the South is due to the very much larger proportion of negro women at work.

Age.—Children and very old persons must be supported by the labor of persons between the extremes of youth and old age. The time of life at which self-support begins differs with the precocity of the child, the class of work, and the ability and desire of the child's supporters to extend the period of training into the years of youth. As the census gets returns from all persons at least 10 years of age and classifies them by age periods it is possible to trace the rise and decline of gainful occupation from the age of 10 years to the end of life. The extended figures for the negroes will be found in Table 9 and those for whites in Tables 5, 6, and 7 of the Special Report on Occupations. For present purposes the per cents alone are important.

TABLE LIX.—*Per cent of population engaged in gainful occupations, for the negro and white races by sex and age periods: 1900.*

AGE PERIOD.	PER CENT OF POPULATION ENGAGED IN GAINFUL OCCUPATIONS: 1900.			
	Male		Female.	
	Negro.	White.[1]	Negro.	White.[1]
Continental United States:				
10 years and over	84.1	79.5	40.7	16.0
10 to 15 years	49.3	22.5	30.6	7.0
16 to 24 years	89.0	83.4	47.9	29.1
25 to 34 years	95.4	96.4	41.8	17.3
35 to 44 years	96.5	96.6	41.6	12.7
45 to 54 years	97.0	95.4	42.2	11.7
55 to 64 years	95.5	89.5	41.0	10.8
65 years and over	84.9	66.9	28.5	7.3
Age unknown	75.1	51.7	38.3	17.9

[1] Figures are for continental United States, Alaska, Hawaii, and military and naval.

The preceding table shows that in 1900 a larger relative number of breadwinners is found among negroes than among whites for each sex and each age period, except 25 to 34 and 35 to 44 when, among men, the proportion of whites reported as occupied is slightly greater than that of negroes. The larger proportion of breadwinners among all male negroes at least 10 years of age is shown by this table to be due to the fact that they begin to work at an earlier age and stop at a later age than the whites. Of white boys between 10 and 15 years of age less than one-fourth have a gainful occupation; of negro boys of the same age nearly one-half are at work. This difference continues into the next age period, nearly nine-tenths of the negroes and only five-sixths of the whites between 16 and 24 years of age having a gainful occupation. From 25 to 55 years of age at least nineteen-twentieths of the men of each race are at work, and the differences between the races are insignificant. But between 55 and 65 a certain number of whites cease to work, the proportion of breadwinners sinking to a little less than nine-tenths. Among men at least 65 years of age five-sixths of the negroes and only two-thirds of the whites are occupied.

Among females the differences are much more striking. Of negro girls between 10 and 15 nearly one-third are reported as at work; of white girls not quite one-fourteenth. At the next age period, 16 to 24, not far from one-half the female negroes are occupied, while the proportion among female whites is less than one-third. Among female whites the proportion of breadwinners is much less at the next age period, 25 to 34, and is still lower between 35 and 44, when only about 1 in 8 is engaged in gainful occupations. With negro women the proportion at later ages remains high. Between 25 and 65 years of age about 2 out of 5 are reported as breadwinners, and at the age of 65 years and over the proportion remains still above one-fourth. The figures show clearly that in the case of negro women marriage does not withdraw them from the field of gainful occupation to anything like the extent that it does white women. Gainful employment on the part of white women is evidently in many cases a preliminary to married life, a large proportion of the white women over 25 years of age who were at work being undoubtedly drawn from the ranks of the single and the widows. On the other hand a good part of the per cent of negro women between 25 and 64 years of age who were engaged in gainful occupations must have been married, as 68.3 per cent of all negro women between those ages were so reported.

It is not to be inferred at once and without examination that the great prevalence of child labor among negroes of both sexes is a racial rather than an economic characteristic. It may be due to the difference in the character of the occupations mainly followed by

the two races. Farming is an industry in which work of some sort is easily found for young boys and old men, and farming in the South also provides a large field for the work of women. It is well known that the negro population of continental United States is much more exclusively occupied in agriculture than is the white population. Of the male negro breadwinners in continental United States 58.4 per cent were returned as engaged in agricultural pursuits and 17.3 per cent were returned as laborers without further designation of the occupation. Probably most of these also were agricultural laborers. Of the male white breadwinners 37.2 per cent were engaged in agricultural pursuits and 9.6 per cent were laborers not specified. Probably about 70 per cent of the male negro workers and not much more than 40 per cent of the male white workers are engaged in farming.

The most direct way to make a fair comparison between the races, were it possible, would be to limit it to the Southern states where agriculture is the predominant occupation of both. But the Special Report on Occupations does not afford material for such a comparison. In default of that the following method may throw a little light on the problem: The negroes living in cities having at least 2,500 inhabitants are 22.7 per cent of the entire number in continental United States (Table XII). The state which comes nearest to the same proportion of urban population is Kansas, with 22.5 per cent of its population in cities (page 83). Kansas has 58.5 per cent of all its male breadwinners engaged in agricultural pursuits (Twelfth Census, Abstract, Table 66) which agrees closely with the per cent among all negro breadwinners (58.4). The proportion of negroes in Kansas (3.5 per cent) is negligible. The proportion of males and females at each age engaged in gainful occupations in Kansas may then be deemed typical of the proportions prevailing in a white population having about the same proportion engaged in agriculture that is found among all negroes. The results appear in the following table:

TABLE LX.—*Per cent engaged in gainful occupations, for the negro population of continental United States and the total population of Kansas by sex and age periods: 1900.*

AGE PERIOD.	PER CENT ENGAGED IN GAINFUL OCCUPATIONS: 1900.			
	In male negro population of continental United States.	In male population of Kansas.	In female negro population of continental United States.	In female population of Kansas.
10 years and over	84.1	76.1	40.7	10.4
10 to 15 years	49.3	19.9	30.6	2.2
16 to 24 years	89.0	78.0	47.9	18.8
25 to 34 years	95.4	95.5	41.8	12.0
35 to 44 years	96.5	96.7	41.6	8.4
45 to 54 years	97.0	95.8	42.2	8.7
55 to 64 years	95.5	87.7	41.0	8.8
65 years and over	84.9	64.1	28.5	6.0
Age unknown	75.1	55.2	38.3	16.5

Inferences derived from Table LIX comparing all negroes with all whites are not materially modified by the present figures. Both show that the larger proportion of negro men at work is due to the fact that they begin earlier in life and that a larger proportion of them work through later years. In Kansas the proportion of the total male population from 25 to 34 and 35 to 44 years of age at work was slightly larger than that for the male negro population of continental United States at corresponding ages. In the prevalence of female labor the difference between the total population in Kansas and the negro population of continental United States is more marked than that between the two races for the whole country. In Kansas only one-tenth of the total female population, and in the country as a whole about one-sixth of the female white population is gainfully employed; while the proportion of the total women of Kansas between 35 and 65 years of age who are breadwinners is only one-fifth that of the negro women of the country at corresponding ages.

Marital condition.—Some light is thrown upon the figures for occupations when the per cent engaged in gainful occupations is computed for each marital condition and for each race. It has been assumed that all the married, widowed, and divorced who were earning money were at least 15 years of age. On this assumption the per cent of each class and sex and race who were breadwinners was as follows:

TABLE LXI.—*Per cent of population at least 15 years of age engaged in gainful occupations, for the negro and white races by sex and marital condition: 1900 and 1890.*

MARITAL CONDITION.	PER CENT OF POPULATION AT LEAST 15 YEARS OF AGE ENGAGED IN GAINFUL OCCUPATIONS.							
	1900				1890			
	Male.		Female.		Male.		Female.	
	Negro.	White.[1]	Negro.	White.[1]	Negro.	White.	Negro.	White.
Continental United States	92.1	89.0	43.2	17.8	91.7	88.3	39.9	16.3
Single and unknown	86.9	83.8	60.5	41.5	82.6	79.7	59.3	38.3
Married	96.1	94.1	26.0	3.2	98.3	95.7	22.7	2.5
Widowed	89.5	75.3	67.0	25.1	92.3	77.9	62.6	23.4
Divorced	93.7	88.9	82.2	49.0	96.8	90.1	79.8	43.6

[1] Figures are for continental United States, Alaska, Hawaii, and military and naval.

The figures in the preceding table indicate that the greatest difference between the races is found in the case of the married females, the proportion of negro wives who are breadwinners being about eight times that of white wives. The table also indicates that among females of each race in each of the 4 marital classes the proportion of breadwinners in 1900 was greater than it was in 1890. Among the males of each race, however, the proportion is higher only in the case of the single; the husbands, widowers, and divorced men

of each race apparently being a little less generally occupied in 1900 than in 1890, and the increase among the total occupied males being due, therefore, to the fact that the increase among the single men overbalanced the slight decline in each of the other three classes.

LEADING OCCUPATIONS.

Distribution by occupations.—In grouping occupations the Bureau of the Census recognizes five main classes, namely, agricultural pursuits, professional service, domestic and personal service, trade and transportation, and manufacturing and mechanical pursuits. But with a population group including so large a proportion of unskilled labor as the negroes and one with so wide a margin of error in its replies, the lines between these classes are faint and elusive. For example, the large number of persons whose occupation was returned as "laborer" with no further explanation of its nature is a serious stumbling block. Among the negro breadwinners in 1890, 11.4 per cent and in 1900, 13.7 per cent were returned simply as "laborers." Such persons might be farm laborers, railway laborers, factory laborers, or household laborers, and thus belong to any one of the five classes, except the one of least numerical importance, the professional class. Various difficulties, of which this is perhaps the most important, make it seem probable that in some cases, at least, the lines between specific occupations are more clearly defined and so more accurately followed by the enumerators than the lines between the five occupation groups. We pass, therefore, directly to the specific occupations.

The tables of the Twelfth and Eleventh censuses giving the race of persons engaged in specified occupations in the several states and territories, omit certain occupations followed in the state or territory by only a few persons. On this account it is impossible to state the exact number of southern negroes or whites engaged in a specified occupation, but only the sum of the numbers separately reported for the several Southern states and territories. Table LXXIX of this section gives the number of negroes at least 10 years of age engaged in each of 140 occupations in 1900, classified by sex, for the area of enumeration and for continental United States. In the general tables of the Special Report on Occupations corresponding figures for whites and other races are shown for the area of enumeration, but not for continental United States. For this section figures for whites in continental United States in 1900 have been computed by adding together the numbers separately reported for a specified occupation in each state and territory. Figures thus obtained necessarily include only the number of persons classified by sex and race in the table for states and territories, and are therefore slightly less than the correct totals, which are not available from the statistics of occupations for 1900.

The following table states the number of negroes in continental United States in each of the 27 occupations which gave employment to at least 10,000 negroes in 1900:

TABLE LXII.—*Negro population at least 10 years of age engaged in specified occupations, and per cent distribution: 1900.*

OCCUPATION.	NEGRO POPULATION AT LEAST 10 YEARS OF AGE ENGAGED IN GAINFUL OCCUPATIONS: 1900.		
	Number.	Per cent distribution by occupation.	Total of per cents in column 2, to and including specified occupation.
Continental United States:			
All occupations	3,992,337	100.0	
Occupations giving employment to at least 10,000 negroes in 1900	3,807,008	95.4	
Agricultural laborers	1,344,125	33.7	33.7
Farmers, planters, and overseers	757,822	19.0	52.7
Laborers (not specified)	545,935	13.7	66.4
Servants and waiters	465,734	11.7	78.1
Launderers and laundresses	220,104	5.5	83.6
Draymen, hackmen, teamsters, etc.	67,585	1.7	85.3
Steam railroad employees	55,327	1.4	86.7
Miners and quarrymen	36,561	0.9	87.6
Saw and planing mill employees	33,266	0.8	88.4
Porters and helpers (in stores, etc.)	28,977	0.7	89.1
Teachers and professors in colleges, etc.	21,267	0.5	89.6
Carpenters and joiners	21,113	0.5	90.1
Turpentine farmers and laborers	20,744	0.5	90.6
Barbers and hairdressers	19,942	0.5	91.1
Nurses and midwives	19,431	0.5	91.6
Clergymen	15,528	0.4	92.0
Tobacco and cigar factory operatives	15,349	0.4	92.4
Hostlers	14,496	0.4	92.8
Masons (brick and stone)	14,386	0.4	93.2
Dressmakers	12,569	0.3	93.5
Iron and steel workers	12,327	0.3	93.8
Seamstresses	11,537	0.3	94.1
Janitors and sextons	11,536	0.3	94.4
Housekeepers and stewards	10,596	0.3	94.7
Fishermen and oystermen	10,427	0.3	95.0
Engineers and firemen (not locomotive)	10,224	0.2	95.2
Blacksmiths	10,100	0.2	95.4
Other occupations	185,329	4.6	100.0

In the preceding table the second column gives the per cent that the negroes in the specified occupation constituted of all negroes in all forms of gainful occupations, and the third column gives the cumulative per cent as it is called, that is, the per cent that the number in the occupation specified together with all those preceding, constituted of all negroes in gainful occupations. Thus, this column shows that negro agricultural laborers, farmers, planters, and overseers, laborers (not specified), servants and waiters, and launderers and laundresses, constituted 83.6 per cent or about five-sixths of the negroes in all gainful occupations in continental United States. The same column shows that these 27 occupations include 95.4 per cent, or over nineteen-twentieths of all negroes in gainful occupations.

Table LXIII gives for continental United States the number of negroes engaged in each of the 27 leading occupations in 1900 and 1890 and the number and per cent of increase. Table LXIV gives for the South the same information for the negroes, Indians, and Mongolians.

TABLE LXIII.—*Negro population at least 10 years of age engaged in specified occupations: 1900 and 1890.*

[1] The tables of the Twelfth and Eleventh censuses in regard to the race of persons engaged in specified occupations in the several states and territories, omit certain occupations followed in the state or territory by only a few persons. On this account it is impossible to state the exact number of southern negroes or whites engaged in a specified occupation, but only the sum of the numbers separately reported for the several Southern states and territories.
[2] Not separately reported for states and territories. [3] Decrease.

For reasons already specified the boundary lines between agricultural laborers, farmers, planters and overseers, and laborers not specified, are so ill defined that it seems inadvisable to attempt an interpretation of the figures regarding these occupations. Accordingly, the following discussion begins with the occupation "servants and waiters," and pays special attention to those occupations, the boundary lines of which are believed to be most clearly defined.

Servants and waiters.—In continental United States in 1890 there were 401,215 negroes whose occupation was returned as that of servant or waiter; in 1900 the number was 465,734, an increase during the decade of 64,519, or 16.1 per cent. During the same period the reported number of white servants and waiters increased from 1,035,748 to 1,077,877, or 4.1 per cent. It will be noticed that in both cases the apparent increase of this class was less, in the case of the whites very much less, than the increase of the population. As a result of this there were reported in 1890, 232 servants and waiters to each 10,000 people, and in 1900 only 205. It is hardly possible to accept these figures as indicating anything more than an increasing differentiation of occupations and a shifting of the lines between this class of occupations and others. As will appear later, the more specialized classes of occupations which come closest to those of servants and waiters, such as housekeepers and stewards, launderers and laundresses, and nurses and midwives, have been increasing much more rapidly than the population. The class of servants and waiters may be regarded then, to some degree, as a residual class out of which these other occupations have been gradually differentiated. If such a process is in progress, it would affect first the higher grades of service. The low percentage of increase among white servants and waiters may perhaps be interpreted as indicating that this process of specialization has been in more rapid progress among them than among the negroes.

But the industrial conditions in the South are so different from those in the North and West that here again one is in danger of being misled unless attention is confined to the two races in that part of the country. In 1890 there were 408,941 servants and waiters in the Southern states; in 1900 the number had increased to 435,940, or 6.6 per cent. As the population increased much more rapidly than this, there were in 1890 in the South 206 servants and waiters to every 10,000 persons, and in 1900 only 178. The proportion of non-Caucasians in the total class of servants and waiters increased during the decade from 753 per thousand in 1890 to 776 in 1900.

The differentiation and specialization suggested as a cause of the decline in the number of servants and waiters relative to population probably progresses more rapidly in a city than in a country district. Whether the proportion of negroes in the servant and waiter class is higher and has increased more rapidly in the southern cities than in the whole South may be indicated by the figures for the District of Columbia,

containing more negroes than any other city in the country. The ratio of servants and waiters to population in the District of Columbia (72 per thousand) is four times the average for the whole South, but the proportion, like that for the whole country and the whole South, has decreased since 1890, when it was 75 per thousand. Among these servants and waiters in the District of Columbia (17,291 in 1890 and 20,129 in 1900) the proportion of non-Caucasians has increased from 839 per thousand in 1890 to 866 in 1900, the proportion of whites decreasing to correspond from 161 per thousand in 1890 to 134 in 1900. The per cent non-Caucasian in total population in the District of Columbia (31.3 per cent) is about the same as in the whole South (32.6 per cent), and yet the proportion of non-Caucasians among the servants and waiters in the District of Columbia is greater than that for the whole South (866 per thousand for the District of Columbia, 776 per thousand for the whole South), and is increasing somewhat more rapidly (27 in the per thousand in the District of Columbia, and 23 in the per thousand in the whole South, 1890 to 1900). These figures seem to support the explanation suggested.

Launderers and laundresses.—In 1900 there were 220,104 negro launderers and laundresses reported in continental United States. The number reported in 1890 was only 153,684, indicating an increase during the decade of 66,420, or 43.2 per cent. Meantime the white launderers and laundresses in the country increased from 74,563 in 1890 to 139,536 in 1900, or 87.1 per cent, about twice as fast as the negroes. In 1890 there were 619 negro launderers and laundresses in each 1,000 engaged in that industry, while in 1900 there were but 570, a loss of 49. There was a decline also in the proportion of Chinese, Japanese, and Indians in the industry, the proportion of whites rising from 300 per thousand in 1890 to 362 in 1900.

But these figures need to be supplemented by those for the Southern states alone. In so doing the figures for all non-Caucasians must be used.

Non-Caucasian launderers and laundresses increased in the South from 131,662 in 1890 to 191,825 in 1900, or 45.7 per cent, which is between two and three times as fast as the increase in the negro population of the country. Probably much of this increase is due to the differentiation of occupations, both in work and name, which was in progress during the decade. The occupation of laundering in the South is very largely monopolized by the negro race, 93.5 per cent of all launderers and laundresses in 1890 and 91.2 in 1900 being non-Caucasians. The figures suggest, however, that in 1900 the monopoly was a little less complete than in 1890. The following table gives the number of non-Caucasian launderers and laundresses reported for each Southern state in 1900 and 1890, and the per cent they make of the total persons in that occupation. The per cent that the non-Caucasians make of the total population is shown in the last column.

TABLE LXV.—*Number and per cent of negro, Indian, and Mongolian launderers and laundresses: 1900 and 1890.*

STATE OR TERRITORY.	NEGRO, INDIAN, AND MONGOLIAN LAUNDERERS AND LAUNDRESSES.		PER CENT OF NEGROES, INDIANS, AND MONGOLIANS AMONG LAUNDERERS AND LAUNDRESSES.		Per cent negro, Indian, and Mongolian in total population: 1900.
	1900	1890	1900	1890	
The South	191,825	131,662	91.2	93.5	32.6
South Atlantic division	99,309	75,808	93.5	95.4	35.8
Northern South Atlantic	37,083	26,732	89.2	92.3	23.7
Delaware	477	292	77.7	84.6	16.6
Maryland	9,642	8,208	84.9	89.3	19.8
District of Columbia	7,321	5,403	95.5	95.9	31.3
Virginia	18,871	12,373	94.2	95.8	35.7
West Virginia	772	456	41.2	52.7	4.5
Southern South Atlantic	62,226	49,076	96.2	97.2	44.8

Indian Territory	481	.....	59.5	.....	22.8
Oklahoma	373	68	58.0	(1)	7.7
Texas	15,539	9,114	80.2	85.0	20.4

[1] Per cent not shown where base is less than 100.

Draymen, hackmen, teamsters, etc.—The number of negro draymen, hackmen, teamsters, etc., reported in 1900 in continental United States was 67,585. The number in 1890 was 43,963, an increase of 23,622, or 53.7 per cent, in the decade. Meantime the whites in this occupation increased from 324,311 to 470,169, or 45 per cent. These figures seem to indicate that the negroes are more than holding their own in this field of work. But close analysis shows that the high rate of increase among negroes is due in large degree to the fact that in the South the reported number of draymen, hackmen, and teamsters increased 62.8 per cent, while in the rest of the country it increased only 42.8 per cent.

When the figures are confined to the Southern states, it is found that the non-Caucasians in this occupation increased 50.5 per cent, and the whites increased 74.9 per cent. In 1890 there were in the South 1,079 more non-Caucasian than white draymen, hackmen, and teamsters; and in 1900 there were 6,044 more white than non-Caucasian. Or stating the relations proportionately of 1,000 draymen, hackmen, and teamsters in the South in 1890, 508 were non-Caucasians; in 1900 only 471 were non-Caucasians.

Steam railroad employés.—This occupation group includes many different sorts of work, with different degrees of skill and different rates of compensation. It will be passed over, therefore, with little attention. One may notice, however, that in the country as a whole negroes reported as so employed increased 16.4 per cent, and whites 26.1 per cent. In consequence, the proportion of negroes reported among persons in this group fell from 103 per thousand in 1890 to 95 per thousand in 1900; or if the figures be confined to the Southern states

it appears that the proportion of non-Caucasians among steam railroad employees fell from 395 per thousand in 1890 to 376 in 1900. The proportion in 1900, however, was greater than the proportion of non-Caucasians in the total population of the South.

Miners and quarrymen.—The number of negro miners and quarrymen in continental United States in 1900 was 36,561. In 1890 there were only 19,007, an increase during the ten years of 17,554, or 92.4 per cent. Although the number of negro miners and quarrymen is large and the increase rapid, this occupation in continental United States is confined mainly to the whites, only 6.5 per cent in 1900 and only 4.9 per cent in 1890 of the miners and quarrymen in the country being negroes. But the figures indicate that in the country as a whole the negroes have strengthened their hold upon this occupation. This is partly due to the fact that mining and quarrying as an occupation has increased more rapidly in the South than it has in the rest of the country, the number of miners and quarrymen in that section having increased 93.7 per cent between 1890 and 1900, while the number in the rest of continental United States increased only 39.1 per cent. These figures show that miners and quarrymen increased in the South between two and three times as fast as in the rest of the country. In the Southern states in 1890 there were 3,006 miners and quarrymen, whose race was not specified in the detailed tables for states and territories; in 1900 there were only 370. This makes it difficult to determine with accuracy the increase for the two races in the South. If those of unknown race at each census be distributed according to the proportions prevailing among the known, the following results for the South are reached:

	Total.	White.	Non-Caucasian.
1900	87,815	60,141	27,674
1890	45,334	31,854	13,480

The per cent of non-Caucasians among the miners and quarrymen of the Southern states in 1890 was 29.7, and in 1900 was 31.5, indicating that negro miners and quarrymen in the South have rather more than held their own in the decade.

Saw and planing mill employees.—This is hardly a well-defined occupation class, different sorts of labor requiring different sorts of strength, skill, and ability being included under this one head. The increase of negro employees during the ten years in continental United States was 15,990, and that of the white employees was only 6,359, the former increase being two and a half times as great. In 1890 seven-eighths of this class of employees were white and only one-eighth negro, while in 1900 only four-fifths were white and one-fifth negro. But here again it is misleading to consider alone the figures for continental United States. Saw mills and planing mills have been developing in the South with great rapidity. The increase in this class of employees, 1890 to 1900, for the country as a whole was 22,946, while for the South alone it was 31,441, indicating a net decrease in this class of employees for the North and West of 8,495, while the increase in the South was 79.3 per cent. Among the employees in the South 41.6 per cent in 1890 and 46.1 in 1900 were non-Caucasians, indicating an increase of 4.5 in the per cent of non-Caucasians among persons engaged in this industry in the South.

Porters and helpers (in stores, etc.).—Among the 24,356 persons reported with this occupation in continental United States in 1890, 11,694, or 48 per cent, were negro, a fraction of 1 per cent were Indian or Mongolian, and the remainder, 51.5 per cent, were white. In 1900 the negro porters and helpers had increased to 28,977, while the white had increased from 12,545 to 24,245, so that the per cent of negroes in this occupation increased from 48 to 53.5, while that of whites had correspondingly declined. Owing to the fact that in 1890 the classification by race for the several states and territories grouped porters and helpers with messengers and packers, the figures for the Southern states in 1890 are not available, but in 1900 more than nine-tenths of the porters and helpers (91.6 per cent) were non-Caucasians.

Teachers and professors in colleges.—The number of negro teachers in continental United States in 1890 was 15,100; in 1900 there were 21,267, an increase of 6,167, or 40.8 per cent, which was more than twice as rapid as the increase of negro population. The increase in the number of white teachers during the same period was from 332,187 to 424,269, or 27.7 per cent. Negro teachers constituted in 1890, 4.3 per cent and in 1900, 4.8 per cent of the total number of teachers, showing a slight increase in the proportion of negroes. In the South the number of non-Caucasian teachers increased during the decade from 13,317 to 19,188, or 44.1 per cent, the corresponding increase for the whites being from 59,544 to 80,970, or 36 per cent. In the South the non-Caucasian teachers constituted in 1890, 18.3 per cent and in 1900, 19.2 per cent of all teachers, showing an increase in the proportion of negro teachers slightly higher than that for continental United States.

Probably the number of negro teachers in the South is at least an approximate measure of the amount of teaching furnished negro youth. Assuming this to be true, the ratio of negro teachers to negroes 5 to 20 years of age has some significance.

The number of non-Caucasian teachers to 10,000 non-Caucasians 5 to 20 years of age in the South, together with the corresponding figures for whites, is stated below.

	1900	1890
Negro, Indian, and Mongolian	59	46
White	129	115

The increase in the relative number of teachers 1890 to 1900 has been about the same for the two groups, and as a result the difference between the races has declined. In 1890, 10,000 southern white children had about 2.5 times as many teachers as 10,000 negro, Indian, and Mongolian children; the corresponding ratio for 1900 being about 2.2.

Carpenters and joiners.—The number of negroes engaged in this occupation decreased from 22,581 in 1890 to 21,113 in 1900. The decrease was not peculiar to the negro race, the number of white carpenters and joiners having also declined, but by a smaller per cent. In the Southern states the number of negro, Indian, and Mongolian carpenters and joiners decreased from 20,591 in 1890 to 19,451 in 1900, or 5.5 per cent, and the whites in this occupation increased from 94,861 in 1890 to 100,459 in 1900, or 5.9 per cent. These figures seem to indicate that the negroes are not holding their own in this occupation; in fact, among 1,000 carpenters and joiners in the South, 178 in 1890 and 162 in 1900 were non-Caucasians.

Turpentine farmers and laborers.—In 1890 this occupation was classified under "other agricultural pursuits," and thus no comparison can be made.

Barbers and hairdressers.—In 1890 there were 17,480 negro barbers and hairdressers in continental United States; in 1900 the number had risen to 19,942, an increase of 2,462, or 14.1 per cent, a ratio of increase somewhat less than that of the negro population. During the same period the number of white barbers and hairdressers increased 64.5 per cent, a little more than three times as rapidly as the white population. In 1890, 20.6 per cent and in 1900, 15.2 per cent of the barbers and hairdressers of the country were negro. That is, their proportion in this industry has declined from one-fifth in 1890 to less than one-sixth in 1900. In the South the number of non-Caucasian barbers and hairdressers increased from 8,025 in 1890 to 10,343 in 1900, an increase of 28.9 per cent. During the same period the number of white barbers and hairdressers doubled. In consequence of this more rapid increase the per cent of non-Caucasians among all barbers in the South fell from 60.4 in 1890 to 49.4 in 1900. The foregoing figures indicate that the increase of negro barbers and hairdressers in the South has been more rapid than the increase of negro population or of total population, but much less rapid than the increase of white barbers and hairdressers. The increase of non-Caucasian barbers and hairdressers in continental United States was 2,027, while the increase for the South alone, excluding the few hundred for whom the race was not reported in the table for states and territories, was 2,318. This shows that the increase in the South was greater by 291 than the total increase for the country and that outside of the Southern states, therefore, the number of negro barbers and hairdressers slightly decreased in the ten years, the per cent of non-Caucasians among the barbers and hairdressers of the Northern and Western states being 14.2 in 1890 and 9.1 in 1900.

Nurses and midwives.—In 1900 there were 19,431 negro nurses and midwives in continental United States; in 1890 the number reported was only 5,213, the increase during the decade being 14,218, or 272.7 per cent. Meantime the number of whites engaged in this occupation increased only about half as fast, from 42,345 in 1890 to 100,349 in 1900, or 137 per cent. In 1890 the negro nurses and midwives formed 11 per cent of all persons following this occupation, and in 1900, 16.1, a gain of 5.1. The whites show a corresponding decline.

The same gain in the number of negro nurses and midwives appears from the figures for the South. Here the number of non-Caucasian nurses and midwives increased from 4,221 in 1890 to 17,286 in 1900, the increase being 13,065, or 309.5 per cent. At the same time the white nurses and midwives increased from 3,876 in 1890 to 10,396 in 1900, or 168.2 per cent, a little over half as fast. In 1890 non-Caucasian nurses and midwives constituted 52.1 per cent of the total number in the South; in 1900 the per cent was 62.4.

Clergymen.—The number of negro clergymen in continental United States in 1900 was 15,528, as compared with 12,159 in 1890, the increase being 3,369, or 27.7 per cent. White clergymen increased somewhat less rapidly, from 75,972 in 1890 to 94,437 in 1900, or 24.3 per cent. With both races the number of clergymen increased more rapidly than the population.

In the South the number of non-Caucasian clergymen rose from 10,159 in 1890 to 12,841 in 1900, the increase being 2,682, or 26.4 per cent. The increase in white clergymen was from 17,688 in 1890 to 21,387 in 1900, or 20.9 per cent. Of the total clergymen in the South in 1890, 36.5 per cent were non-Caucasian, and in 1900, 37.5, a gain of 1. Clergymen of all races increased somewhat more rapidly in the North and West than in the South. In both continental United States and the South the increase is greater for negroes than for whites, but only in the South has the proportion changed appreciably.

The assumption already made in the case of teachers, that in the South the number engaged in the profession is a rough measure of the amount of service furnished the negro, may be made with greater confidence regarding clergymen and may be extended to the whole country. In continental United States the number of clergymen of each race to each 100,000 persons of the same race was as follows:

	1900	1890
Negro, Indian, and Mongolian	171	160
White	141	138

The foregoing figures indicate that negro clergymen are more numerous than white clergymen per unit of population; that the increase in this occupation for both races has been more rapid than the increase of population, and that among negroes the increase has been more rapid than among whites. An interesting difference appears between the figures for continental United States and those for Cuba, where, in 1899, among 283 clergymen only 4 were negroes, and for Porto Rico, where among 124 clergymen only 2 were negroes.

In the South the number of clergymen of each race to each 100,000 persons of the same race was as follows:

	1900	1890
Negro, Indian, and Mongolian	160	150
White	129	135

Corresponding figures for the North and West were:

	1900	1890
Negro, Indian, and Mongolian	239	234
White	145	139

The foregoing figures indicate that negro clergymen in each division of the country, but especially in the North and West, are much more numerous per unit of population than white clergymen. They show also that the relative number in the North is much greater than in the South. Whether this is due to the larger proportion of city residents in the North or whether it indicates a better economic position of the northern negroes can not be determined from the figures.

Tobacco and cigar factory operatives. The number of negro tobacco and cigar factory operatives in continental United States was 15,349 in 1900 and 15,004 in 1890, an increase during the decade of 345, or 2.3 per cent. The number of whites in this occupation was 114,042 in 1900 and 94,176 in 1890, an increase of 21.1 per cent. The per cent of negroes among tobacco and cigar factory operatives in the country fell from 13.4 in 1890 to 11.7 in 1900.

In the South the number of negro, Indian, and Mongolian tobacco and cigar factory operatives was 14,296 in 1900 and 14,013 in 1890, the increase being 283, or 2 per cent. The whites engaged in this occupation in the South were 17,773 in 1900 and 14,547 in 1890, an increase of 22.2 per cent. The per cent of non-Caucasians among tobacco and cigar factory operatives in the South was 49.1 in 1890, but only 44.6 in 1900. The proportion of negroes among tobacco and cigar factory operatives is declining in the country as a whole and especially in the South.

Hostlers.—The number of negro hostlers in continental United States in 1900 was 14,496 and in 1890, 10,500, the increase being 3,996, or 38.1 per cent. White hostlers numbered 49,840 in 1900 and 43,500 in 1890, an increase of 14.6 per cent, or only about two-fifths as fast. The per cent of negroes among hostlers thus increased from 19.4 in 1890 to 22.3 in 1900. As hostlers were grouped with livery stable keepers in the table for states and territories at the Eleventh Census, figures for the South in 1890 are not available. In 1900 the non-Caucasian hostlers in the South numbered 8,637, being 68.8 per cent of the total number.

Masons (brick and stone).—In 1900 the number of negroes occupied as brick and stone masons was 14,386 and in 1890, 9,760, the increase being 4,626, or 47.4 per cent. The number of whites reported as engaged in this occupation decreased from 151,029 in 1890 to 146,173 in 1900, or 3.2 per cent. The per cent of negroes among all persons in the occupation rose from 6.1 in 1890 to 8.9 in 1900. For the South there are no figures for 1890, when brick and stone masons were grouped with marble and stone cutters in the table showing occupations by race for states and territories, but in 1900, the 9,926 negroes, Indians, and Mongolians engaged as brick and stone masons in the South comprised 38.6 per cent of the total. In the South the proportion of negroes among all engaged in this occupation is somewhat greater than the proportion of negroes in the total population (32.3 per cent).

Dressmakers.—The number of negro dressmakers in 1900 was 12,569 and in 1890, 7,586, the increase during the decade being 4,983, or 65.7 per cent. White dressmakers increased from 285,813 in 1890 to 331,841 in 1900, or 16.1 per cent, only one-fourth as fast. The per cent of negroes among all dressmakers rose from 2.6 in 1890 to 3.6 in 1900, being still very small. Even for the South in 1900 the 8,296 non-Caucasian dressmakers constituted only 16.8 per cent of the total. No figures for the South in 1890 are available, dressmakers being reported with milliners, seamstresses, and others in the table for states and territories.

Iron and steel workers.—In 1900 the number of negro iron and steel workers reported in continental United States was 12,327 and in 1890, 6,579, the increase being 5,748, or 87.4 per cent. Iron and steel workers of the white race were 277,539 in 1900 and 213,822 in 1890, an increase of 29.8 per cent, or a little over one-third as fast. In 1900 the negroes formed 4.2 per cent and in 1890, 3 per cent of the total number engaged in this occupation.

For the South the number of negroes, Indians, and Mongolians reported as iron and steel workers was 8,736 in 1900 and 4,435 in 1890, the increase during the decade being 4,301, or 97 per cent. The number of whites in this occupation in the South was 19,464 in 1900 and 14,690 in 1890, an increase of 32.5 per cent, one-third as fast. Between 1890 and 1900 the non-Caucasian iron and steel workers in the South increased from 23.2 to 31 per cent of the total number, a gain of 7.8 per cent. The per cent of increase in iron and steel workers was greater for each race in the South than in

the whole country, and decidedly more marked for negroes than for whites. It is evident that the development of the iron and steel industry in the Southern states in recent years has opened new avenues of labor to a considerable number of negroes.

Seamstresses. The occupation of seamstress stands with those of carpenter and joiner and of blacksmith as one of the three important occupations in which the number of negro breadwinners decreased between 1890 and 1900. There were 11,846 negro seamstresses in continental United States in 1890, but only 11,537 in 1900, the decrease being 309 or 2.6 per cent. The number of whites in this occupation likewise shows no increase. There were 138,072 white seamstresses in the United States in 1890 while in 1900 the total number was only 137,960, an apparent decrease of 112, or 0.1 per cent. The decline being greater among negroes than whites the per cent of negroes among seamstresses fell from 7.9 in 1890 to 7.6 in 1900.

For the Southern states in 1900 the number of negro, Indian, and Mongolian seamstresses was 9,766, constituting 24.6 per cent of the total classified by race. No figures by race are available for 1890, but as the total number of seamstresses in the South decreased 15.3 per cent for the decade it is probable that the decline in the number and proportion of negro seamstresses in the whole country was true also of this section. This decline for both races may be connected with the increase in the number of dressmakers already noted and with the increased production of women's clothing in factories, the employees in such factories having been reported as 39,149 in 1890 and 83,739 in 1900. Probably few such employees would return their occupation as that of seamstress.

Janitors and sextons.—The number of negro janitors and sextons in continental United States in 1900 was 11,536 and in 1890, 5,945, the increase during the decade being 5,591, or 94 per cent. Meantime the white janitors and sextons increased somewhat more rapidly -from 20,552 in 1890 to 43,956 in 1900, or 113.9 per cent. The per cent of negroes among all janitors and sextons consequently fell from 22.4 in 1890 to 20.4 in 1900. For the Southern states figures by race are available only for 1900. There were then 3,560 non-Caucasian janitors and sextons in the South, constituting 65 per cent of the total classified by race.

Housekeepers and stewards. -In 1900 there were 10,596 negro housekeepers and stewards in continental United States, and in 1890, 9,248, the increase being 1,348, or 14.6 per cent. White housekeepers and stewards numbered 142,805 in 1900 and 82,614 in 1890, an increase of 72.9 per cent. In 1890 the negroes constituted 10, and in 1900, 6.8 per cent of all housekeepers and stewards, a loss of 3.2 in the per cent.

For the Southern states the number of negro, Indian, and Mongolian housekeepers and stewards decreased between 1890 and 1900. The number in 1890 was 6,346, and in 1900, 5,901, a decrease of 445, or 7 per cent. White housekeepers and stewards, however, increased 47.5 per cent, the number being 13,258 in 1890 and 19,550 in 1900. As a result the per cent of non-Caucasians among housekeepers and stewards in the South fell from 32.4 in 1890 to 23.2 in 1900, a decline of 9.2 in the per cent. The rapid increase of white housekeepers and stewards, like that of launderers and laundresses, may be connected with the differentiation and specialization of occupations already suggested in explanation of the decline of servants and waiters relative to population, this movement being more marked among whites than among negroes.

Fishermen and oystermen.—The number of negro fishermen and oystermen in continental United States was 10,071 in 1890 and 10,427 in 1900, the increase being 356, or 3.5 per cent. The number of whites in this occupation increased more than four times as fast—from 48,920 in 1890 to 56,354 in 1900, an increase of 15.2 per cent. In 1890, 16.7, but in 1900 only 15.1 per cent of all fishermen and oystermen were negroes, other non-Caucasians constituting about 2 per cent of the total at each census.

For the Southern states alone the number of negro, Indian, and Mongolian fishermen and oystermen increased from 8,999 in 1890 to 9,984 in 1900, the increase being 985, or 10.9 per cent. Meantime the number of whites increased from 14,630 to 21,276, or 45.4 per cent, about four times as fast. Consequently the per cent of non-Caucasians in this occupation in the South fell from 38.1 per cent in 1890 to 31.9 in 1900, a decline of 6.2 in the per cent, this decline being greater than that for negroes in the whole country.

Engineers and firemen (not locomotive).—In 1900, 10,224 negroes were reported as engineers and firemen (not locomotive). The number in continental United States in 1890 was 6,326, the increase for the decade being 3,898, or 61.6 per cent. At the same time the number of whites increased from 133,398 in 1890 to 212,974 in 1900, or 59.7 per cent. The per cent of negroes in this occupation was 4.5 in 1890, and 4.6 in 1900, a small gain.

The number of negroes, Indians, and Mongolians reported in this occupation for the Southern states alone was 4,649 in 1890, and 7,694 in 1900, the increase being 3,045, or 65.5 per cent. The increase for whites in the South was from 17,573 in 1890 to 29,562 in 1900, or 68.2 per cent. The per cent of non-Caucasians in the occupation, therefore, fell from 20.9 in 1890 to 20.7 in 1900, a negligible loss. The increases for each race were more rapid in the South than in the whole country, which, probably, reflects the growing use of motive power in the Southern states.

Blacksmiths.—The occupation of blacksmith is one for which the number of negroes reported was less in 1900 than in 1890. The number in continental United States in 1890 was 10,988 and in 1900, 10,100, the de-

crease being 888, or 8.1 per cent. Meantime the number of white blacksmiths increased from 198,525 in 1890 to 216,027 in 1900, or 8.8 per cent, this increase being at about the same rate as the decrease for negroes. The per cent of negro blacksmiths in the total number fell from 5.2 in 1890 to 4.5 in 1900. The 8,979 negro, Indian, and Mongolian blacksmiths in the Southern states in 1900 constituted 18.2 per cent of the total classified by race, no figures by race being available for 1890. An estimate of the negro, Indian, and Mongolian blacksmiths in the South in 1890 may be made by assuming that they constitute the same per cent (87.5) of the number of negro, Indian, and Mongolian blacksmiths in the entire country in 1890 as in 1900. On this assumption there were about 9,674 non-Caucasian blacksmiths in the South in 1890 and 8,979 in 1900, a decrease of 7.2 per cent. During the same period the number of white blacksmiths in the South increased from about 31,691 to 40,288, or 27.1 per cent. These figures indicate that in the blacksmith industry the negroes have been losing ground absolutely and relatively.

VITAL STATISTICS.

Nature of inquiry.—The Twelfth Census contains no statistics of births or marriages. It has been found impracticable to gather information through census enumerators regarding either the births or the marriages that occurred during the census year with enough completeness to make the resulting figures worth their cost. The records of state or municipal registration offices upon births and marriages—the only alternative sources of information—are often lacking, and where they exist are incomplete in so many cases that no satisfactory statistics of births or marriages for the United States can be derived from them.

With reference to deaths, the third and most important of the main branches of vital statistics, the case is somewhat different. For half a century the census has gathered information regarding deaths during the census year from the families visited by the enumerators. To be sure, not more than two-thirds of all the deaths can be obtained in this way, but even such incomplete returns have their value. For most of the population of the United States this is the only source of information, but for a few Northern states and most of the larger cities the enumerators' returns are inferior to the local records of deaths. The latter are seldom complete and in the country districts of the Southern states, where most of the negroes live, they do not exist at all. Hence the census can supply little information regarding the death rate among the negroes, and what information it has is open to the serious objection that it is derived mainly from the registration records of cities, and that inferences from this class to the whole race are very likely to be erroneous or misleading.

Death rate.—The death rate means the number of deaths occurring in a year to each 1,000 persons living in the middle of that year. No means are available for determining the death rate of the negro race in the United States. But 13.4 per cent of the negroes of continental United States live in what is called the registration area; that is, the area where records of deaths are kept by local officers and are regarded by the Census Bureau as being complete enough to be accepted. Doubtless a number of deaths in the registration area are not recorded, and omissions of deaths are probably more frequent among negroes than among whites. Notwithstanding these qualifications, the following figures for the registration area in 1900 deserve consideration:

TABLE LXVI.—*Population, number of deaths, and death rate, for the negro and white races: 1900.*

RACE.	1900		
	Population.	Number of deaths.	Death rate.
The registration area:			
Negro	1,180,546	35,710	30.2
White	27,555,800	475,640	17.3

The registration area in 1890 was not coextensive with the registration area in 1900 and the figures for the negroes, to the exclusion of the Chinese, Japanese, and Indians, are not available. The published death rate of whites in the registration area in 1890 was 19.1, and that of negroes, Indians, and Mongolians, 29.9. The corresponding death rate for the negroes, Indians, and Mongolians in 1900 was 29.6. The main inferences derived from these figures, namely, that the non-Caucasian race has a very much higher death rate than the white and that its death rate has slightly decreased in the last decade, may probably be accepted as correct.

Death rate by sex.—It is impossible to state the number of deaths among the negroes in the registration area with distinction of sex, the data published being for the negroes, Indians, and Mongolians combined. But as the Indians and Mongolians constitute only 5.7 per cent of the entire non-Caucasian population of the registration area, their inclusion does not add materially to the margin of error from other sources.

TABLE LXVII.—*Population, number of deaths, and death rate, for the negro, Indian, and Mongolian population by sex: 1900.*

SEX.	NEGRO, INDIAN, AND MONGOLIAN POPULATION: 1900.		
	Population.	Number of deaths.	Death rate.
The registration area:			
Total	1,251,469	37,029	29.6
Male	615,209	19,328	31.4
Female	636,260	17,701	27.8

The foregoing figures indicate a death rate for male negroes decidedly higher than that for female. A similar relation exists for whites, the death rate of

male whites in the same area being 18.4 and that of female only 16.1. In each race the death rate of females is less than nine-tenths that of males. Table LXVII shows that there is a decided excess of females in the non-Caucasian population of the registration area. This is greater than the excess of females in the negro population of the country, there being in the former 508 and in the latter only 503 females to 1,000 persons. As the healthier sex is found in the registration area in greater excess than in the entire country this difference alone would tend to make the true death rate of negroes in the registration area lower than that in the entire country. Whether it is neutralized by other tendencies does not appear.

Death rate by age.—There is no influence upon mortality so powerful as that of age. The death rate during the earlier years, especially the first year of life, and the death rate in extreme age are far above the average for all ages. On the other hand, the death rates during the years from 5 to 55 are usually below and those at the ages from 10 to 15 far below the average. The large proportion of negro children has already been mentioned. This would tend to cause a high death rate for the race. On the other hand, the low proportion over 55 years of age would tend to cause a low death rate.

The population of the registration area has been classified by race with distinction of age, but no division of age groups at 55 was made. The best alternative is the division at 65. The negro, Indian, and Mongolian population and the white population of the registration area were distributed through the healthy and the unhealthy periods of life as follows:

TABLE LXVIII.—*Per cent distribution, by age periods, for the negro, Indian, and Mongolian and the white population: 1900.*

RACE.	PER CENT OF POPULATION IN SPECIFIED AGE PERIOD: 1900.			
	Under 5 years.	5 to 64 years.	65 years and over.	Unknown.
The registration area:				
Negro, Indian, and Mongolian	8.2	88.4	2.7	0.7
White	10.3	85.0	4.5	0.2

The figures show that in the registration area the negroes, Indians, and Mongolians had a smaller proportion of children and also a smaller proportion of aged persons than the whites. The proportion of children indicates how far the total non-Caucasian population of the registration area is from being typical of the negro population of continental United States. In the former 8.2 and in the latter 13.8 per cent[1] are children under 5 years of age. This difference is due in part to the fact that the registration area includes 56,913 Mongolians, most of them adults, but more to the fact that 93.2 per cent of the negro population in the registration area lives in registration cities, largely those of the North, and under conditions which do not favor the development of family life and the birth and rearing of children. This analysis shows that in the matter of age composition, as well as in the matter of sex composition, the non-Caucasian population of the registration area is far from being representative of the negro population of the United States, and that in both respects it is more favorable to a low death rate than is the negro population of the country as a whole.

The death rates for the negro, Indian, and Mongolian and the white population of the registration area, by age periods, are as follows:[2]

TABLE LXIX.—*Death rate by age periods for the negro, Indian, and Mongolian and the white population: 1900.*

AGE PERIOD.	DEATH RATE: 1900.	
	Negro, Indian, and Mongolian population.	White population.
The registration area:		
All ages	29.6	17.3
Under 5 years	118.5	49.7
5 to 14 years	9.8	4.1
15 to 24 years	15.6	5.9
25 to 34 years	16.9	8.6
35 to 44 years	21.0	11.1
45 to 64 years	36.7	21.5
65 years and over	108.6	86.0

These figures indicate that below the age of 25 the death rate of the negroes is more than double that of the whites and from 25 to 44 it is nearly double. A careful consideration of the figures suggests that the favorable sex and age composition of the negro population of the registration area tends to obscure the true difference of mortality between the two races. To ascertain whether this is true, the white population of the registration area of each sex and each specified age period may be multiplied by the observed death rate of the negroes, Indians, and Mongolians for the same sex and age. The sum of the resulting series of products represents the deaths that would have occurred in the negro, Indian, and Mongolian population of the registration area had it been as large as, and with the same sex and age distribution as the white population. If this sum be divided by the total number of whites of known age in the registration area a death rate of 33.5 is obtained, which is the death rate that the non-Caucasian population of the registration area would have had, provided its sex and age composition had agreed with that of the whites, and the death rate of each sex and age had been that observed for the non-Caucasians. The difference between this 33.5 and the 29.6 in Tables LXVII and LXIX measures the effect of the advantageous sex and age composition of the non-

[1] Twelfth Census, Abstract, Table 11.

[2] Twelfth Census, Vol. III, page lxxxii.

Caucasian population in the registration area, in masking the true difference in death rate between the races. One is warranted, then, in saying that according to the best evidence obtainable the death rate of the negroes in the registration area is nearly double that of the whites in the same area.

As the only information that the Census Bureau possesses regarding the death rates of the two races is based upon the returns from the registration area, and as the sex and age composition of the negroes in that area has been shown to be favorable to a low death rate, it may be worth while to estimate what the death rate of the non-Caucasians and of the whites throughout the country in 1890 and in 1900 would have been, provided that the death rate of the whites of each sex and at each age period had been the same as that observed for the whites in the registration area, and that the death rate of the non-Caucasians of each sex and at each age period had been the same as that observed for the non-Caucasians (about nineteen-twentieths being negro) in the registration area. On these assumptions the computed death rate of the non-Caucasians in 1890 was 34.4 and in 1900, 34.2; of the whites in 1890, 19.5, and in 1900, 17.4. It seems not improbable that these figures may be trusted so far as they indicate that there has been a decline in the death rate of each race during the last ten years, that the decline among the negroes has been less rapid than that among the whites, and that the death rate of the negroes at the present time is about, but not quite, twice that of the white race.

With reference to the preceding death rates, it should be said that the death rate of the negroes in cities is probably higher than in country districts, and so far as this factor is concerned, the computed death rate for the entire negro population is too high. On the other hand, it has been found that the records of deaths in the registration area are incomplete, and it is probably true that such omissions have occurred more frequently among the negroes. This factor would tend to make the true death rate higher than that observed. Of these two influences upon the figures acting in contrary directions it is probable that the former is the more powerful, but it is impossible to affirm that with confidence, much less to obtain any measure of the departure of the figures from the truth.

Ratio of children to women.—In default of any trustworthy statistics on the birth rate of either race, it may be of interest to state the proportion of children under 5 years of age in the two races, as throwing some light upon the fecundity of the population. One may compare the number of children either with the total population or with the number of women of childbearing age. Neither of these methods has exclusive validity and each has its advantages. For the present purpose, however, the second method seems to be the more significant. As the negro population has an excess of females and the white population an excess of males, and as the white population has a decidedly larger proportion of elderly persons, the present comparison will show smaller differences between the two races than would a comparison of the children under 5 years of age with the total population. The age questions in 1880 and 1900 were identical and differed slightly from the form used in 1890. For this reason comparisons between the figures for 1880 and 1900 are safer than those between the figures for 1890 and any other census.

The figures include with the negroes, the Indians and Mongolians, but these do not constitute a large enough part of the total to affect the proportions seriously.

TABLE LXX.—*Number of children under 5 years of age to 1,000 females 15 to 44 years of age, for the negro, Indian, and Mongolian and the white population: 1900, 1890, and 1880.*

CENSUS.	NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 44 YEARS OF AGE.	
	Negro, Indian, and Mongolian population.	White population.
Continental United States:		
1900	585	508
1890	619	517
1880	759	586

The foregoing figures show for each 1,000 non-Caucasian women of childbearing age in 1900, 77 more children than for each 1,000 white women. They show also a steady decline in the proportion of children to women of childbearing age during the twenty years, a decline which has been shared by both races, but which is steadier and far more marked among the non-Caucasians than among the whites. In the former the decline has been 174—that is, in 1900 there were 174 less children under 5 years of age to each 1,000 non-Caucasian women 15 to 44 years of age than there were in 1880. Among the whites the decline in the same period has been 78, or less than half as great.[1]

Here, again, in order to eliminate the disturbing influence of the fact that nearly nine-tenths of the negroes and only one-fourth of the whites are living in the South Atlantic and South Central states, it is best to confine the attention to the whites and the non-Caucasians in that section. This has also the incidental advantage of excluding most of the Indian and Mongolian population and making the term non-Caucasian more nearly synonymous with negro, for in the Southern states as a whole, less than 1 per cent of the total non-Caucasian population is Indian or Mongolian.

[1] For tables giving detailed figures by states and territories see pages 423 and 424.

TABLE LXXI.—*Number of children under 5 years of age to 1,000 females 15 to 44 years of age, for the negro, Indian, and Mongolian and the white population in the South: 1900, 1890, and 1880.*

CENSUS.	NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 44 YEARS OF AGE.	
	Negro, Indian, and Mongolian population.	White population.
South Atlantic and South Central divisions:		
1900	621	633
1890	648	631
1880	793	711

The results for the Southern states agree with those for the country as a whole in showing for each race a decided decline in the proportion of children. For the non-Caucasians the decline has been 172 during the twenty years, while for the whites it has been only 78, or less than half as great. One noteworthy difference, however, appears. The number of children to 1,000 women of childbearing age in the South is now 12 greater for the whites than it is for the non-Caucasians, while in the country as a whole it is 77 less, this change having come about in the Southern states within the last decade, as the result of a continued decline in the proportion of children among the non-Caucasians and a slight increase in the proportion among the whites. This decrease in the proportion of negro children in the South, 1890 to 1900, while the proportion of white children in the same region increased, may be connected with that relative decrease of negro husbands and wives in the South while white husbands and wives were increasing, to which attention has already (page 223) been called.

With the foregoing figures giving the proportion of children for the two races in the Southern states, the following, giving the same proportion for the North and West, may be compared:

TABLE LXXII.—*Number of children under 5 years of age to 1,000 females 15 to 44 years of age, for the negro, Indian, and Mongolian and the white population in the North and West: 1900, 1890, and 1880.*

CENSUS.	NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 44 YEARS OF AGE.	
	Negro, Indian, and Mongolian population.	White population.
North Atlantic, North Central, and Western divisions:		
1900	355	470
1890	400	484
1880	505	548

The figures show that the proportion of children among the negroes, Indians, and Mongolians of the North and West has uniformly been less than the proportion among the whites, and that the difference has been increasing, the decline among the non-Caucasians in the twenty years having been 150, while the decline among the whites was only 78.

In the following table the figures have been given for the two main divisions of the South:

TABLE LXXIII.—*Number of children under 5 years of age to 1,000 females 15 to 44 years of age, for the negro, Indian, and Mongolian and the white population in the South: 1900, 1890, and 1880.*

CENSUS.	NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 44 YEARS OF AGE.			
	South Atlantic division.		South Central division.	
	Negro, Indian, and Mongolian population.	White population.	Negro, Indian, and Mongolian population.	White population.
1900	630	595	612	659
1890	638	587	659	665
1880	787	666	799	749

It will be noticed that for each race in each of the two divisions there has been a decline in the proportion of children during the past twenty years, and that the same was true for each decade except for the whites in the South Atlantic division in the decade, 1890 to 1900. In that division the twenty-year decline among the non-Caucasians has been 157, and among the whites 71; while in the South Central division the decline among the non-Caucasians has been 187 and among the whites 90, showing for each section that the decline in the proportion of children among the negroes has been about twice that among the whites.

In the following table corresponding figures are given for the four minor divisions of the South:

TABLE LXXIV.—*Number of children under 5 years of age to 1,000 females 15 to 44 years of age, for the negro, Indian, and Mongolian and the white population in the South: 1900, 1890, and 1880.*

DIVISION AND CENSUS.	NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 44 YEARS OF AGE.	
	Negro, Indian, and Mongolian population.	White population.
Northern South Atlantic		
1900	525	542
1890	544	536
1880	695	623
Southern South Atlantic:		
1900	674	653
1890	681	645
1880	833	713
Eastern South Central:		
1900	598	630
1890	639	631
1880	785	712
Western South Central:		
1900	633	692
1890	690	713
1880	824	813

The table shows that for the non-Caucasians in each of the four minor divisions the number of children to 1,000 women has declined in both decades, while for the whites the number increased between 1890 and 1900 for each of the divisions of the South Atlantic states, and was practically stationary for the Eastern South Central states. In both of the South Atlantic and in the Eastern South Central divisions the decline, 1880 to 1900, for the non-Caucasians has been more than twice as great as for the whites, but in the Western South Central the difference between the two races, while marked, has not been so great as elsewhere (a decline of 191 for the non-Caucasians and 121 for the whites). In each of these divisions except the Southern South Atlantic, the proportion of children among the non-Caucasians in 1900 is less than among the whites.

In the following table the corresponding figures are given for the various states and territories of the South:

TABLE LXXV.—*Number of children under 5 years of age to 1,000 females 15 to 44 years of age, for the negro, Indian, and Mongolian and the white population: 1900, 1890, and 1880.*

STATE OR TERRITORY AND CENSUS.	NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 44 YEARS OF AGE.

1880	869	853

5734—06——16

On examination of the foregoing table it will be seen that in each Southern state there has been a decline during the last twenty years in the number of children to 1,000 women for both non-Caucasians and whites. The changes in the last decade are perhaps less significant than for the twenty-year period, owing to the change in the form of the age question in 1890 previously mentioned. Among the non-Caucasians the twenty-year decline in the proportion of children was least in Maryland and Delaware, but this was partly due to the fact that in 1880 the proportions in those states were lower than anywhere else in the South, except the District of Columbia. The next smallest declines were in Florida and Louisiana, closely followed by Georgia and South Carolina. At the present time the proportion of white children to 1,000 white women 15 to 44 years of age is larger than the proportion of non-Caucasian children to 1,000 non-Caucasian women in the District of Columbia, West Virginia, North Carolina, Florida, Kentucky, Tennessee, Alabama, Mississippi, Louisiana, Arkansas, Oklahoma, and Texas, or 12 out of the 18 Southern states. In 1880 the proportion among the whites was higher in only two, West Virginia and Kentucky.

These figures indicate that in the last twenty years there has been a decline in the proportion of children for both races in all the Southern states; that the decline has gone on in general among the negro population about twice as rapidly as among the whites, and that as a consequence the proportion of children to 1,000 women among the negroes at the present time in two-thirds of the Southern states is smaller than the proportion among the whites.

TABLE LXXVI.—NUMBER AND PERCENTAGE OF INCREASE IN WHITE AND NEGRO POPULATION, BY STATES AND TERRITORIES: 1790 TO 1900.

Mechanics (not otherwise specified)	377	376	1	377	376	1

[1] In agricultural districts agricultural laborers and, similarly, in manufacturing districts unskilled workmen are often reported simply as "laborers."
[2] Includes paid housekeepers in private families, hotels, etc., matrons in public and private institutions, and stewards and stewardesses.
[3] Sailors at sea are liable to be omitted unless they are actual members of families which are enumerated.
[4] Includes all persons so occupied, irrespective of where they are employed.

TABLE LXXIX.—NEGRO PERSONS 10 YEARS OF AGE AND OVER ENGAGED IN EACH OF 140 GROUPS OF OCCUPATIONS, CLASSIFIED BY SEX, FOR THE UNITED STATES: 1900—Continued.

OCCUPATION.	UNITED STATES.			CONTINENTAL UNITED STATES.

INTERSTATE MIGRATION.

By Joseph A. Hill, Ph. D.

SUMMARY OF RESULTS.

This study of interstate migration is based upon the census statistics classifying the native population of the United States by state or territory of birth.

At the census of 1900 the population of continental United States included 51,891,039 persons living in the state or territory in which they were born, and 13,511,728 persons born in continental United States but not living in the state or territory of birth. In this study these two classes are designated as resident natives and interstate migrants, respectively.

At the census of 1850, which was the first census containing statistics classifying the native population by state or territory of birth, the number of resident natives was 13,457,049 and the number of interstate migrants 4,251,250. Since 1860 there has been a decline in the relative importance of the migrant class. In 1860 the interstate migrants constituted 24.8 per cent, or almost one-fourth, of the total population born in continental United States; in 1900 they constituted only 20.7 per cent, or but a little more than one-fifth, of that population. The decline was much smaller in the decade 1890 to 1900 than in any previous decade, the per cent in 1890 being 20.9.

Of the 13,511,728 interstate migrants enumerated at the census of 1900, 6,257,677 were living in a state or territory contiguous to that of birth, and 7,254,051 were living in other or noncontiguous states and territories.

The per cent of the population born in continental United States migrating to contiguous states decreased from 11.9 in 1850 to 8.7 in 1890, and then increased to 9.6 in 1900; while the per cent migrating to noncontiguous states steadily decreased from 13.9 in 1860 to 11.1 in 1900. Thus the comparison indicates that the per cent of migration to contiguous states, though formerly decreasing, is now increasing, while that to noncontiguous states continues to decrease.

The emigrants from any state or division of continental United States comprise the population born in that state or division and living elsewhere in continental United States; the immigrants comprise the population living in that state or division and born elsewhere in continental United States.

The number of emigrants from each minor geographic division has increased in every decade for which statistics are available, with the following exceptions: The number of New England emigrants has decreased since 1880 and the number of emigrants from the Southern North Atlantic division since 1890, and the number from each of the South Atlantic divisions decreased between 1880 and 1890.

For New England and the Southern North Atlantic division the decade of greatest increase in the number of emigrants was 1850 to 1860; for the Eastern North Central division, 1880 to 1890; and for each of the divisions west of the Mississippi, 1890 to 1900. For each of the southern divisions east of the Mississippi the increase was greater between 1890 and 1900 than in any other decade since 1870; the large increase shown for each of these divisions between 1860 and 1870 was probably due in large part to the fact that the figures for 1860 did not include the slave population.

The number of native immigrants in each minor geographic division increased during every decade covered by these statistics, with the following exceptions: In the Southern North Atlantic division there was a decrease between 1850 and 1860, in the Eastern North Central between 1870 and 1890, in the Western North Central between 1890 and 1900, and in the Eastern South Central between 1850 and 1860 and between 1870 and 1890.

For each of the four Atlantic divisions the increase in the number of native immigrants was greater between 1890 and 1900 than in any previous decade. For the Eastern North Central division the increase was greatest between 1850 and 1860, the earliest decade covered by these statistics. For the Western North Central the decade of greatest increase was 1870 to 1880; for the Rocky Mountain and Pacific divisions, 1880 to 1890; and for the Basin and Plateau division, 1890 to 1900. In the Eastern South Central division the exceptionally large increase shown by the figures for 1860 and 1870 was probably due to the fact that the birthplace statistics of 1860 did not include the slave population. In the Western South Central division—exclusive of Indian Territory and Oklahoma, for which there are no statistics prior to 1890—the decade of greatest increase was 1870 to 1880.

Migration has been mainly westward. In most cases the migration from any division to a division on the west exceeds that to an equally accessible division on the east. The relative importance of the westward migration is, however, declining, while that of the eastward migration is increasing.

The decline of westward migration is most apparent in the migration to the North Central states. The population living in the Eastern North Central states and born in the North Atlantic states has steadily decreased since 1870; the population living in the Western North Central states and born in states east of the Mississippi has decreased since 1890.

On the other hand, there has been an almost unbroken increase in the migration to each geographic division from divisions farther west, and in most cases this increase was greater between 1890 and 1900 than in any previous decade.

The per cent of emigration, as the term is here used, means the per cent of the natives of a given division, state, or territory that are living in other divisions or in other states and territories.

The per cent of emigration from the several minor geographic divisions ranges from 4.8 for the Western South Central to 17.8 for the Eastern South Central.

The per cent of emigration from the several states and territories varies from 9.3 for Texas to 43.7 for Nevada. The per cent of long distance emigration, as represented by the population born in a given state and migrating to noncontiguous states, varies from 2.6 for New Mexico to 25.7 for Maine.

The states from which more than 25 per cent or one-fourth of the natives have emigrated to other states include Maine, New Hampshire, Vermont, Delaware, Virginia, Ohio, Indiana, Illinois, Iowa, Kansas, Wyoming, and Nevada. The states from which less than 15 per cent of the natives have emigrated to other states include West Virginia, Florida, Louisiana, Texas, Oklahoma, New Mexico, Arizona, and California. Of the states showing the high per cent of emigration, all except Virginia are Northern or Western states, and of the states showing the low per cent, all except West Virginia and Oklahoma border on the southern boundary of the United States.

The per cent of emigration from any state to other states is affected in some degree by the size of the state and its geographical location. Other things being equal, the emigration from a small state will be greater in proportion to the population born in the state than the emigration from a large state; again, the emigration from a state entirely surrounded by other states will exceed that from a border state.

For all the Northern states east of the Mississippi except Maine and Michigan, there was a decline in the per cent of emigration in 1900 as compared with 1890, and for most of these states this was the continuation of a decline extending back through one or more of the preceding decades.

For the Southern states east of the Mississippi there was a general decrease in the per cent of emigration, extending through two or more decades prior to 1890. For five of these states—Virginia, the two Carolinas, Kentucky, and Tennessee—the per cent showed a further decrease in 1900; but for the other eight states there was an increase between 1890 and 1900.

For all states and territories west of the Mississippi except North Dakota, Oklahoma, and Arizona, the per cent of emigration increased between 1890 and 1900, and for many of these states the beginning of the increase dates back to the earliest census for which statistics are available.

The preceding comparisons point to the general conclusion that east of the Mississippi the emigration from the Northern states, as measured by the per cent of the natives of each state living in other states, is declining or approaching a period of decline, while the emigration from many of the Southern states is entering upon a period of increase following an extended period of decline; and that west of the Mississippi emigration is increasing, and in the case of many states has been increasing since the earliest census for which statistics are available.

Of the population living in cities having over 25,000 inhabitants, 56.2 per cent were born in the state or territory of residence, 17.3 per cent in other states or territories of continental United States, and 26.0 per cent in foreign countries; for the population living in smaller cities or country districts the corresponding per cents are 72.5, 18.0, and 9.2, respectively. Thus, while the proportion of resident natives is less in the larger cities than in the smaller cities and country districts, and the proportion of foreign immigrants is much greater, the proportion of native immigrants is about the same.

The large cities, however, contain more native immigrants in proportion to the native population than do the smaller cities and country districts. Interstate migrants constitute 23.5 per cent of the population born in continental United States and living in the large cities, and 19.9 of the same class of population living in smaller cities and country districts.

Migrants are concentrated in cities to a greater degree than are resident natives. Of the total number of interstate migrants in continental United States, 25.2 per cent are living in cities of at least 25,000 inhabitants; the proportion of resident natives living in this class of cities is 21.4 per cent. In every minor geographic division except the Western South Central, and in all but 3 of the 37 states containing cities of the size here considered, the per cent living in these cities is higher for native immigrants than for resident natives.

The concentration in large cities appears to be more

marked in the long distance migration than in the short distance. In every minor geographic division except the two South Atlantic, the per cent living in cities is higher for immigrants than for intradivisional migrants, using the latter term to designate the population born in one state and living in another in the same geographic division; and in all but 9 of the 37 states containing cities with at least 25,000 inhabitants the per cent living in such cities is higher for immigrants from noncontiguous states than for those from contiguous states.

The larger cities are absorbing an increasing proportion of the interstate migration. The 124 cities which had a population of at least 25,000 in 1890 contained 20.1 per cent of the total number of interstate migrants in 1890, and 23.1 per cent of the total number in 1900.

Measured by the per cent which the migrants form of the total population born in continental United States, the migration to the larger cities is increasing, while that to smaller cities and country districts is decreasing. The per cent of migration to cities having a population of at least 25,000 in 1890 advanced from 4.2 in 1890 to 4.8 in 1900; the per cent of migration to smaller cities and country districts declined from 16.7 in 1890 to 15.9 in 1900. Thus the decrease in the per cent of total migration from 20.9 in 1890 to 20.7 in 1900 was the effect of a decline in the migration to the smaller cities and country districts.

The increase in the per cent of migration to the larger cities is apparent in the long distance migration (from noncontiguous states) as well as in the short distance (from contiguous states), but is more marked in the latter migration. The decrease in the per cent of migration to smaller cities and country districts is apparent in the long distance migration only, the per cent of short distance migration showing an increase.

The number of interdivisional immigrants living in the larger cities increased between 1890 and 1900 in every minor geographic division.

In each of the two North Central divisions the number of interdivisional immigrants living in smaller cities and country districts has decreased since 1890. In the Eastern North Central the decrease was but small, being the result of a decrease in Ohio and Michigan partially offset by an increase in the other states of this division. In the Western North Central division the decrease was large, and was common to all states in that division except Minnesota and North Dakota. In each division the decrease was produced by a decline in immigration from divisions farther east.

For the white population of continental United States the per cent of interstate migration is 21.5; for the negro population it is 15.6. In a comparison which is confined to population born and living in Southern states the contrast between the two races is less marked, the per cent of migration within the South being 12.9 for whites and 11.0 for negroes.

The per cent of emigration from the South to the North is 7.0 for the whites and 4.3 for the negroes; but the per cent of northward migration from some of the more northerly Southern states—viz, Delaware, District of Columbia, Virginia, West Virginia, North Carolina, and Kentucky—is greater for negroes than for whites.

The movement toward the large cities appears to be more marked among the migrating negroes than among the migrating whites. Of the southern born whites living in Northern or Western states, 26.0 per cent are living in cities having over 25,000 inhabitants; for the corresponding class of negroes (including Indians and Mongolians) the per cent in these cities is 58.0. Of the whites born in one Southern state and living in another, 9.6 per cent were living in the larger cities; the per cent for the corresponding class of negroes (including Indians and Mongolians) is 18.5.

CLASSIFICATION OF POPULATION BY BIRTHPLACE.

The birthplace inquiry.—The inquiry as to birthplace was first introduced at the census of 1850. It called for the name of the state, territory, or country in which each free inhabitant enumerated was born. This question has been repeated, without essential change or amplification, in the population schedule of each subsequent census. In the census reports of some European countries the birthplace of the native population is shown by minor civil divisions—the county, municipality, or commune; but in the Federal census of the United States no attempt has been made to determine the birthplace by political divisions smaller than the state or territory.

Since the introduction of the birthplace inquiry the reports of every census have contained tables classifying the population of each state or territory—the free population in 1850 and 1860, and the total population at subsequent censuses—according to the state, territory, or country of birth. In the reports of the census of 1850 the tabulation was not carried beyond this point, but in subsequent censuses the analysis of the birthplace returns has been more or less elaborated or supplemented by further tabulations.

The census of 1860 gave the birthplace distribution for the white and the free colored male and female population of eight of the principal cities in the United States, and for the total free population of foreign birth living in forty-four cities. The former distribution, by the way, is the only case in which the distinction of sex has been introduced in any tabulation of the birthplace returns.

The distinction of race in the classification by birthplace was carried still farther at the census of 1870,

which gave the state, territory, or country of birth for the white, colored (that is, negro), Chinese (including Japanese), and Indian population of each state and territory, and of fifty principal cities. This report gave, also, for each county, the population born in each of six specified states (including always the state in which the county is located) and in each of twelve specified foreign countries.

In the birthplace tables of the Tenth Census there was no distinction of race or color, except in the distribution by birthplace of the native population of each state and territory the statistics for the native white and the native colored (the latter consisting of negroes, Indians, and Mongolians) being shown separately. The total population of the fifty principal cities was distributed by state, territory, or country of birth. The method of treating county population was similar to that adopted in 1870, ten states or territories and ten foreign countries of birth being specified in each case.

In the birthplace tables of the Eleventh Census for each state and territory the total native population, the native white—divided into native white of native parentage and native white of foreign parentage—and the native colored were distributed separately according to state or territory of birth, and the total foreign population was distributed according to country of birth. For the principal cities the distribution was the same, except that the native colored were not shown; the list of such cities was extended so as to include all of the 124 cities having a population of at least 25,000. For counties the birthplace tabulation of the native population was abandoned, but the tabulation of the foreign born was given in greater detail than before, the number of specified countries of birth being considerably increased.

The tabulation of the birthplace returns at the Twelfth Census was substantially the same as at the Eleventh, the only essential change being the substitution of the native negro population for the native colored in the tables giving the birthplace distribution of the population of states and territories.

The classification by birthplace has been used to some extent in connection with the statistics of the alien population, of the defective, dependent, and delinquent classes, of occupations, and of mortality; but except in the case of aliens there is a growing tendency to substitute a classification according to birthplace of parents.

Analysis of population by birthplace.—In an analysis of the population with regard to birthplace, the primary distinction which is perhaps the most natural and obvious is that between population born within the territory or under the jurisdiction of the country to which the inquiry relates and population born in other countries—that is, between the natives of the country and the foreign born. Of the population of the United States enumerated at the Twelfth Census, 65,843,302, or 86.3 per cent, were returned as natives, and 10,460,085, or 13.7 per cent, as foreign born. The former included not only persons born within the area of enumeration, but also persons born in the outlying districts as Porto Rico or the Philippine Islands—either before or after the acquisition of these territories by the United States, persons born at sea on vessels carrying the United States flag, and American citizens by birth born in foreign countries. Accordingly in the Twelfth Census terminology the term "United States" referring to the place of birth has a wider significance and covers a greater area than the term "United States" referring to the territory within which the population enumerated was living.

On the basis of a comparison of birthplace with residence, the natives of the United States may be divided into two main classes—those living in the state or territory of their birth, and those living elsewhere. To the former the term "resident natives" has been applied; the latter may be designated as "migrating natives" or as "native migrants."

The native migrants included in the population enumerated by the census comprise persons born in a specified state or territory within the area of enumeration and either living in some other state or territory or stationed abroad in the military or naval service of the United States, persons born outside the area of enumeration but within the territory or under the jurisdiction of the United States, and American citizens by birth born in foreign countries.

The several classes here referred to may be distinguished in the following analysis of the population:

Population of the United States enumerated at the Twelfth Census	76,303,387
Natives of foreign countries	10,460,085
Natives of the United States	65,843,302
Born within the area of enumeration	65,581,915
Living in the state or territory of birth	51,979,651
Living in other states and territories	13,528,095
Stationed abroad in the military or naval service of the United States	74,169
Born outside the area of enumeration	68,194
In Porto Rico	680
In the Philippine Islands	345
At sea under the United States flag	2,276
Abroad	65,193
State or territory of birth not specified	192,893

Of the total native population enumerated at the Twelfth Census, 51,979,651, or 78.9 per cent, were residing in the state or territory in which they were born. The remainder of the native population of known birthplace is composed of migrants—comprising natives born within the area of enumeration but not residing in the state or territory of their birth, and natives born outside the area of enumeration. The total number of known migrants, 13,670,758, constitutes 20.8 per cent of the total native population. It

is of course impossible to determine how many of the 192,893 natives of the United States for whom the state or territory of birth was not specified were migrants, and accordingly their status as regards this classification must remain unknown. The following statement summarizes the results of this analysis for 1900:

CLASS OF POPULATION.	Number.	Per cent of total native population.
Total native population	65,843,302	100.0
Resident natives	51,979,651	78.9
Migrants	13,670,758	20.8
State or territory of birth not specified	192,893	0.3

Of the 13,670,758 migrants, 13,511,728 represent the interstate migration within the limits of continental United States; 88,613, a migration from continental United States to the outlying districts within the area of enumeration; 70,074, a migration to continental United States from outlying districts or from birthplaces outside the area of enumeration; and 343, a migration outside the limits of continental United States—either from one outlying district to another, or from birthplaces outside the area of enumeration to outlying districts within that area. These different classes may be distinguished in the following analysis of the migrant population:

All migrants	13,670,758
Born in area of enumeration	13,602,264
Born in continental United States	13,600,341
Living in continental United States	13,511,728
Living in Alaska	10,607
Living in Hawaii	3,848
Stationed abroad	74,158
Born in area of enumeration—Continued.	
Born in Alaska	606
Living in continental United States	598
Living in Hawaii	6
Stationed abroad	2
Born in Hawaii	1,317
Living in continental United States	1,307
Living in Alaska	1
Stationed abroad	9
Born outside of area of enumeration	68,494
Born in Porto Rico	680
Living in continental United States	678
Living in Alaska	....
Living in Hawaii	....
Stationed abroad	2
Born in Philippine Islands	345
Living in continental United States	340
Living in Alaska	3
Living in Hawaii	....
Stationed abroad	2
Born at sea under the United States flag	2,276
Living in continental United States	2,252
Living in Alaska	3
Living in Hawaii	8
Stationed abroad	13
American citizens born abroad	65,193
Living in continental United States	64,899
Living in Alaska	63
Living in Hawaii	38
Stationed abroad	193

In 1900 the population of continental United States known to be living in the state or territory of birth on the census day was 51,891,039, and the population born in specified states or territories and not living in the state or territory of birth was, as shown in the above statement, 13,511,728. In addition to these classes the total population includes the native population born outside continental United States, the native population for which the state or territory of birth was not specified, and the population born in foreign countries. These different classes are distinguished, for each census from 1850 to 1900, in Table I.

TABLE I.—CLASSIFICATION OF THE POPULATION OF CONTINENTAL UNITED STATES WITH RESPECT TO BIRTHPLACE: 1850 TO 1900.

CENSUS.	POPULATION OF CONTINENTAL UNITED STATES.							
	Aggregate.	Native population.						Foreign born population.
		Total.	Born in continental United States.			Born outside continental United States.	State or territory of birth not specified.	
			Total.	Living in state or territory of birth.	Living in other states and territories.			
1900	75,994,575	65,653,299	65,402,767	51,891,039	13,511,728	70,074	180,458	10,341,276
1890	62,622,250	53,372,703	52,965,719	41,871,611	11,094,108	10,332	396,652	9,249,547
1880	50,155,783	43,475,840	43,475,498	33,882,734	9,592,764	342	.....	6,679,943
1870	38,558,371	32,991,142	32,978,660	25,321,340	7,657,320	220	12,262	5,567,229
1860[1]	27,492,083	23,353,386	23,301,503	[2]17,527,069	[2]5,774,434	2,618	49,265	4,138,697
1850[1,3]	19,987,589	17,742,987	17,708,299	13,457,049	4,251,250	.....	34,688	2,244,602

[1] Exclusive of slave population.
[2] All persons living in territories and reported as born in territories are assumed to have been born in territory of residence.
[3] Based on Tables XVI and XVII of the census report for 1850; the figures for 1850 in the tables which follow are derived from Table XV of that report. See note 3 to Table II.

Migration within the limits of continental United States.—The 13,511,728 persons who according to returns of the census of 1900 were interstate migrants born and living in continental United States constituted 17.8 per cent of the total population of continental United States, 20.6 per cent of the total native population, and

20.7 per cent of the population born in continental United States. The last of these per cents, which measures the extent to which the population born and living in continental United States had migrated from the state or territory of birth to other states and territories, may be designated as the per cent of interstate migration within the limits of continental United States. The per cents at the six censuses were as follows:

1900	20.7
1890	20.9
1880	22.1
1870	23.2
1860	24.8
1850	24.0

Thus in 1900 one in every five of the persons born and living within the area of continental United States was a migrant, in the sense in which the term is here used. The proportion has diminished at each census since that of 1860, when it was 24.8 per cent, or approximately one in four; but the change in the last decade is hardly appreciable, the per cent in 1900 being only two-tenths of 1 per cent lower than that in 1890.[1]

These figures indicate a high degree of mobility on the part of the native population, especially when the fact is taken into consideration that they apply only to migration across state lines, the migration within the limits of the several states and territories not being indicated by census statistics. Doubtless much of the unrecorded intrastate migration exceeds in importance much of the migration across state lines, whether the test be the distance covered or the contrast as regards environment between the place of birth and the place of residence; for a considerable part of the interstate migration is a short distance migration from one city or country district to another just across a state boundary, while a considerable part of the intrastate migration may represent a journey of 200 or 300 miles and a change from rural surroundings to a populous urban center.

How much of the interstate migration is a short distance migration across boundary lines—or what may be termed a border migration—can not be determined from the census returns, as they do not give birthplaces by counties or by any political divisions smaller than states; but it is possible to ascertain how much of it is a migration between adjoining or contiguous states. Of the 13,511,728 native migrants within the limits of continental United States in 1900, 6,257,677, or 46.3 per cent, were living in a state or territory contiguous to that of birth, and 7,254,051, or 53.7 per cent, were living in other, or noncontiguous, states.

For the purpose of this computation two states are treated as contiguous if at any point or for any distance they are separated only by a boundary line, or by a stream or other narrow body of water. Utah and New Mexico are regarded as contiguous, and so are Delaware and New Jersey; on the other hand, Illinois and Michigan are not regarded as contiguous, nor are Maine and Massachusetts. Thus the states contiguous to any given state form a zone encircling that state on all sides except where it is bounded by the ocean or a large lake, or by foreign territory. Of course this zone is of very irregular shape and varying width, and consequently the migration to noncontiguous states is not necessarily a longer migration than that to contiguous states. But the latter includes all the border migration, and the former includes practically all the migration covering a distance of more than four or five hundred miles; hence, roughly speaking, the distinction may be referred to as that between a long distance and a short distance migration.

The distinction between migration to contiguous and noncontiguous states is shown for the migrants enumerated at each census from 1850 to 1900 in the following table:

[1] If, however, the population of Indian Territory, which was not returned by birthplace in 1890 and hence can not be included in the figures for that year in the above table, is excluded from the figures for 1900 also, the per cent of migration in the latter year falls to 20.3. For comparison with the per cent in 1890, this per cent is perhaps more appropriate than that given in the table.

TABLE II.—MIGRATION BETWEEN CONTIGUOUS STATES AND BETWEEN NONCONTIGUOUS STATES WITHIN THE LIMITS OF CONTINENTAL UNITED STATES: 1850 TO 1900.

CENSUS.	POPULATION BORN AND LIVING IN CONTINENTAL UNITED STATES.[1]								
	Total.	Number migrating from state or territory of birth to—					Per cent migrating from state or territory of birth to—		
		All other states.	Contiguous states.		Noncontiguous states.		All other states.	Contiguous states.	Noncontiguous states.
			Number.	Per cent of total.	Number.	Per cent of total.			
1900	65,402,767	13,511,728	6,257,677	46.3	7,254,051	53.7	20.7	9.6	11.1
1890	52,965,719	11,094,108	4,620,467	41.6	6,473,641	58.4	20.9	8.7	12.2
1880	43,475,498	9,592,764	4,083,005	42.6	5,509,759	57.4	22.1	9.4	12.7
1870	32,978,660	7,657,320	3,274,449	42.8	4,382,871	57.2	23.2	9.9	13.3
1860[2]	23,301,503	5,774,434	2,531,865	43.8	3,242,569	56.2	24.8	10.9	13.9
1850[2,3]	17,737,578	4,112,681	2,106,375	51.2	2,006,306	48.8	23.2	11.9	11.3

[1] Exclusive of population born in the United States, state or territory not specified.
[2] Exclusive of slave population.
[3] These figures are of necessity derived from the birthplace table in the census report for 1850, which is not in agreement with the other tables in that report. It is believed, however, that the margin of error is not great enough to affect the validity of the general conclusions and comparisons based upon these figures in this study of interstate migration.

This table indicates that while the per cent of total migration has not materially changed in the last decade, decreasing only from 20.9 in 1890 to 20.7 in 1900, the character of the migration as regards distance has undergone a rather marked change, the per cent of migration to contiguous states showing an increase for the first time since the first statistics were collected, in 1850, while the per cent of migration to noncontiguous states decreased to a greater degree than in any previous decade. Thus, if this comparison of the last two censuses can be accepted as indicating the present tendencies, the per cent of native population migrating to contiguous states is increasing, while the per cent migrating to noncontiguous states continues to decrease.

The table shows also that the increase in the per cent of total migration between 1850 and 1860 represented an increase in migration to noncontiguous states, while the gradual decrease from 1860 to 1890 was common to both classes of migration.

EMIGRATION OF NATIVE POPULATION.

The interstate migrant is an emigrant from one state or territory and an immigrant to another; and interstate migration may accordingly be treated either as an emigration from the state of birth or as an immigration to the state of residence. The discussion which immediately follows presents a comparison, and an analysis with respect to magnitude and destination (residence), of the emigration from the several states and geographic divisions. In another connection the other point of view is adopted, the native migrant population being classified by residence, so as to show the total immigration to each state, territory, or geographic division, and this immigration being then analyzed with respect to its source (birthplace).

Emigration by geographic divisions.—The following table shows what proportion of the population of continental United States born in each main and minor geographic division[1] is living in the state or territory of birth, what proportion is living in other states and territories in the same division, and what proportion is living in other divisions, thus distinguishing between the interstate migration within each division and the emigration to other divisions.

TABLE III.—POPULATION BORN IN EACH GEOGRAPHIC DIVISION AND LIVING IN CONTINENTAL UNITED STATES, CLASSIFIED WITH RESPECT TO RESIDENCE: 1900.

GEOGRAPHIC DIVISION OF BIRTH.	POPULATION OF CONTINENTAL UNITED STATES BORN IN THE SPECIFIED GEOGRAPHIC DIVISION.							
	Total.	Living in—						
		State or territory of birth.		All other states and territories.		Other states and territories in the same division.		Other divisions.

Pacific	1,099,277	958,646	87.2	140,631	12.8	66,252	6.0	71,379	6.8
Total	65,402,767	51,891,039	79.3	13,511,728	20.7	4,196,305	6.4	9,315,423	14.3

Incidentally this table illustrates a general principle which is obvious enough on reflection and should not be lost sight of in any study or analysis of statistics of internal migration, viz, that the smaller and more numerous the divisions or areas into which a given territory is divided, the greater will be the interdivisional migration. Thus in 1900 the total migration between main divisions was 6,165,097, while the total migration between minor divisions was 9,315,423, and the total migration between states and territories was 13,511,728; and if the figures for intercounty migration could be obtained, they would show a total far greater than that for interstate migration. The reason is, of course, that the migration between the smaller areas necessarily includes all the migration between the larger areas and in addition to that the migration between the smaller areas

[1] A map defining these divisions is inserted as the frontispiece of this volume.

lying within each larger area; in other words, only a part of the migration between the smaller areas is also a migration between the larger. Hence the total interstate migration may be divided into two parts: that which is both interstate and interdivisional, and that which is interstate but intradivisional. This subdivision is shown in the following statement:

Total interstate migration	13,511,728
Between minor geographic divisions	9,315,123
Between main geographic divisions	6,165,097
Within main geographic divisions	3,150,326
Within minor geographic divisions	4,196,305

Of the main geographic divisions, the one for which the per cent of the natives migrating from the state of birth to other states was highest, and the per cent living in the state of birth was lowest, is the North Central. Of the natives of that division, 24.4 per cent, or approximately 1 in 4, were migrants; 15.8 per cent migrated from the state of their birth to other states in the same division, and 8.6 per cent migrated to other divisions—these two per cents representing, respectively, the per cent of intradivisional migration and the per cent of emigration to other divisions. The highest per cent of intradivisional migration is that just given for the North Central division. But the highest per cent of emigration is that shown for the South Atlantic division (12.3), which at the same time has the lowest per cent of intradivisional migration (6.1), indicating that the relatively large emigration from this division is accompanied by a relatively small movement of population within the division. The division showing both the smallest per cent of total interstate migration and the smallest per cent of emigration is the Western; of the natives of that division only 15.4 per cent are living outside the state or territory of birth, and only 4.8 per cent have emigrated to other divisions.

Of the several minor divisions, the one showing the highest per cent of emigration to other divisions is the Eastern South Central, and the one showing the lowest is the Western South Central. This contrast between the two adjoining divisions is produced mainly by the large migration from the eastern division to the western and the small return migration from the western to the eastern, and by the fact that the emigration from the eastern division to the North Central states is much larger than that from the western. The Eastern North Central division shows a per cent of emigration almost as high as that for the Eastern South Central. Other minor divisions showing a high per cent of emigration are the Basin and Plateau and the Northern South Atlantic.

The minor division showing the highest per cent of internal migration is New England, and the one showing the lowest per cent is the Basin and Plateau. A glance at the map defining the division boundaries (Map 1) suggests that one of the reasons for the contrast here noted is quite independent of any difference in the social or economic conditions of the two regions, or in the characteristics of their inhabitants: New England is composed of six small states, while the Basin and Plateau division is composed of three large states, each of which covers more territory than the entire group of New England states; consequently, if the internal movement of population were practically the same in the two divisions, the proportion crossing state lines would almost inevitably be larger in the eastern division than in the western.

Thus the figures for interstate migration are affected to a considerable degree by the accidents of political geography, and they should be considered with the map constantly in mind. But it is hardly necessary to add that this is not the only—nor, probably, the principal—source of variation in the percentages of internal migration. The movement of population is determined by a great variety of influences. Some of them may be classified as economic, others are, perhaps, psychological, while climatic conditions and physiographic features undoubtedly play an important part. Some of these influences are too subtle and obscure to be detected by statistical analysis, even if we had at our command a measure of migration much more satisfactory than that afforded by the classification of population according to state or territory of birth. The statistics of interstate migration merely record the final result of these influences in so far as they produce a migration across the network of state boundary lines. In all comparisons allowance must be made for the irregularity of this network, and for the variety in the size and form of the meshes—that is, the states and territories. But while this is a factor which may either exaggerate or diminish the differences and contrasts in the per cent of interstate migration in different sections of the country, it by no means completely explains such differences. For instance, the political map of the country does not account for the fact that the per cent of intradivisional migration is higher for each of the western Central divisions than for either of the eastern Central. Undoubtedly this difference indicates a greater mobility on the part of the population in the newer states which lie west of the Mississippi, probably resulting in part from the fact that these states are less completely settled than the older states east of that river.

Distribution of emigrants by geographic division of residence.—The per cent distribution of the emigrants from each minor geographic division by division of residence is shown in Table IV. In this table the sequence in which the divisions are usually arranged has been changed, in order to bring together for convenience of comparison and discussion the three northern and the three southern divisions east of the Mississippi, and the two Central divisions west of that river.

TABLE IV.—PER CENT DISTRIBUTION, BY MINOR GEOGRAPHIC DIVISION OF RESIDENCE, OF THE EMIGRANTS FROM EACH MINOR GEOGRAPHIC DIVISION: 1900.

MINOR GEOGRAPHIC DIVISION OF BIRTH.	PER CENT OF EMIGRANTS LIVING IN—										
	New England.	Southern North Atlantic division.	Eastern North Central division.	Northern South Atlantic division.	Southern South Atlantic division.	Eastern South Central division.	Western North Central division.	Western South Central division.	Rocky Mountain division.	Basin and Plateau division.	Pacific division.
New England	.....	33.8	22.4	2.7	1.6	1.0	18.2	1.6	4.4	0.8	13.5
Southern North Atlantic	12.0	.....	40.4	7.7	1.1	1.4	22.7	2.2	4.2	0.7	7.6
Eastern North Central	1.3	6.7	.....	2.8	0.7	5.0	57.9	7.9	6.5	0.8	10.4
Northern South Atlantic	3.2	33.4	19.5	.....	6.2	10.9	14.1	7.4	1.9	0.4	3.0
Southern South Atlantic	1.5	5.5	4.7	10.2	.....	37.9	4.3	33.0	1.0	0.3	1.6
Eastern South Central	0.3	1.4	17.9	2.3	6.1	.....	16.7	50.8	1.6	0.4	2.5
Western North Central	1.0	3.1	25.3	0.9	0.5	2.3	.....	28.8	16.1	1.6	20.4
Western South Central	0.9	3.9	9.6	1.7	3.4	27.5	29.2	.....	9.8	2.9	11.1
Rocky Mountain	1.9	5.3	10.9	1.2	0.5	1.0	29.6	8.7	.....	14.9	26.0
Basin and Plateau	0.7	2.0	3.0	0.4	0.2	0.3	5.1	1.9	56.2	.....	30.2
Pacific	5.8	11.7	13.3	2.3	0.7	1.5	17.1	6.2	27.2	14.2	.....

An inspection of the figures in the above table shows that a large proportion of the emigrants from each division are found in the adjoining divisions. The westward drift of migrating population is also apparent; in most cases the emigration from any division to a division on the west exceeds that to an equally accessible division on the east.

Over 65 per cent of the emigrants from New England had migrated farther west than the adjoining Southern North Atlantic division, and about 38 per cent of the emigrants from each of these two divisions were living in the divisions west of the Mississippi. It is noticeable that the Pacific states attracted a larger proportion of the emigrants from New England than of those from any other division east of the Mississippi. Of the emigrants from the Eastern North Central states, 57.9 per cent were found in the adjoining division on the west, the Western North Central; 10.4 per cent in the Pacific division; and only 8.0 per cent in the two North Atlantic divisions. Comparatively few of the emigrants from any northern division east of the Mississippi were found in any southern division.

The importance of the westward migration within the South is indicated by the comparatively high per cent of the emigrants from the Southern South Atlantic division found in each of the two South Central divisions, and the high per cent of those from the Eastern South Central division found in the Western South Central. It is noticeable, however, that only a comparatively small proportion of the emigrants from the Northern South Atlantic states have been attracted to the other southern divisions, most of them being found in the Southern North Atlantic and the two North Central divisions.

For each of the two groups of Central states west of the Mississippi the eastward emigration assumes considerable relative importance, but still does not equal the westward. Most of this eastward movement of population is only a short distance migration across the Mississippi to the adjoining group of Eastern Central states; in 1900 the long distance eastward migration, as represented by the migrants living in the Atlantic states, constituted only 5.5 per cent of the total emigration from the Western North Central division and 9.9 per cent of that from the Western South Central. The westward emigration from the northern division was relatively large, constituting 38.1 per cent of the total; and the greater part of it—20.4 per cent of the total—was a long distance migration to the Pacific coast. The westward emigration from the southern division was relatively less important, constituting only 23.8 per cent of the total, 11.1 per cent being to the Pacific coast. There has been a considerable migration northward and southward between these two divisions. In 1900 the per cent of the migrants from one group of states living in the other was nearly the same in both cases, but in actual numbers the migrants from the northern group to the southern were about five times as numerous as those from the southern to the northern.

The eastward emigration from the Rocky Mountain states exceeds the westward, the emigrants living in divisions to the east in 1900 constituting 59.1 per cent of the total; more than one-third of these—20.8 per cent of the total—were living in states east of the Mississippi, and more than one-seventh—8.9 per cent of the total—in the Atlantic states.

The emigration from the Basin and Plateau states is largely a short distance migration northward and eastward, 56.2 per cent of the emigrants being found in 1900 in the adjoining Rocky Mountain division; 13.6 per cent were living in states farther east, only 6.6 per cent being in states east of the Mississippi. The emigration from this division to the Pacific states constituted 30.2 per cent of the total.

The entire emigration from the Pacific states to other parts of continental United States is necessarily eastward, and in 1900 more than one-third of it—35.3 per cent—was to states east of the Mississippi. The Southern North Atlantic and Eastern North Central states contained 25.0 per cent of these migrants from the Pacific coast, and New England contained 5.8 per cent. These per cents indicate a relatively important long distance eastward migration.

Increase of emigration by geographic divisions: 1850 to 1900.—The population that has emigrated from any state, territory, or division to other parts of continental United States is continually being recruited by additional emigration, and depleted by death, by the

emigration of these migrants to foreign countries or to the outlying districts of the United States, and by their return to the state, territory, or division of nativity. The increase or decrease in the total is the net result of these opposing forces.

The growth or decline of the total population emigrating from each minor geographic division is shown in Table v.

TABLE V.—*Emigration from each minor geographic division: 1850 to 1900.*

MINOR GEOGRAPHIC DIVISION OF BIRTH, AND CENSUS.	POPULATION OF CONTINENTAL UNITED STATES BORN IN THE SPECIFIED MINOR GEOGRAPHIC DIVISION.[1]				
	Total.	Living in specified division.	Living in other divisions (emigrants).		Increase (+) or decrease (−) in the number of emigrants since the preceding census.

[1] Exclusive of slave population in 1860 and 1850.
[2] Exclusive of population reported as born in territories.

The population emigrating from New England showed an increase during each decade from 1850 to 1880. Thereafter it declined, the new emigration not being sufficient to make good the losses produced by death, by emigration to foreign countries and outlying districts, and by the return of natives. In 1900 the number of New England emigrants was smaller by 60,000 than it was twenty years before, having decreased about 10 per cent. The number of emigrants from the Southern North Atlantic division decreased between 1890 and 1900, and the number from each of the South Atlantic divisions between 1880 and 1890.

With the above exceptions there was a steady increase from 1850 to 1900 in the population that had emigrated from each of the minor geographic divisions. Naturally, however, there are noticeable variations in the amount of the increase during different decades. The period of greatest increase was 1850 to 1860 for New England and for the Southern North Atlantic division, 1880 to 1890 for the Eastern North Central division, and 1890 to 1900 for each division west of the Mississippi. The southern divisions east of the Mississippi show a considerable or large increase in the decade 1890 to 1900, following a decrease or small increase in the preceding decade.

In comparing the figures for the southern divisions, it should be remembered that the birthplace tables for 1850 and 1860 do not include the slave population, while those for 1870 relate to the entire population and therefore include the emancipated negroes; this accounts for the large apparent increase between 1860 and 1870 in the population emigrating from each of the two South Atlantic divisions. If the negro population is excluded from the 1870 figures for the four southern divisions, and the number of other emigrants is then compared with the number of free emigrants in 1860, for each of the South Atlantic divisions the increase is changed to a decrease, and for each of the two South Central divisions it is materially reduced. This comparison is shown in the following tabular statement:

MINOR GEOGRAPHIC DIVISION OF BIRTH.	POPULATION, EXCLUSIVE OF NEGROES IN 1870 AND OF SLAVES IN 1860, BORN IN THE SPECIFIED DIVISION AND LIVING IN OTHER DIVISIONS (EMIGRANTS).		
	1870	1860	Increase, 1860 to 1870.
Northern South Atlantic	479,267	525,483	−46,216
Southern South Atlantic	449,753	533,556	−83,803
Eastern South Central	745,764	732,770	12,994
Western South Central	57,581	31,244	26,337

For the other divisions the comparability of the data presented in Table v is not appreciably affected by the fact that the birthplace statistics of the earlier censuses included the free population only.

Increase in the per cent of emigration from geographic divisions. Naturally the number of emigrants from any given division rarely increases at the same rate as the population born in that division, and accordingly

there are variations in the per cent of the natives who are emigrants—that is, the per cent of emigration. These variations reflect the changes in the migratory tendency of the population, although not with such accuracy as would be secured by figures showing the number and per cent of the population emigrating annually or even decennially. The variations in the per cent of emigration from each minor geographic division are shown in Table v.

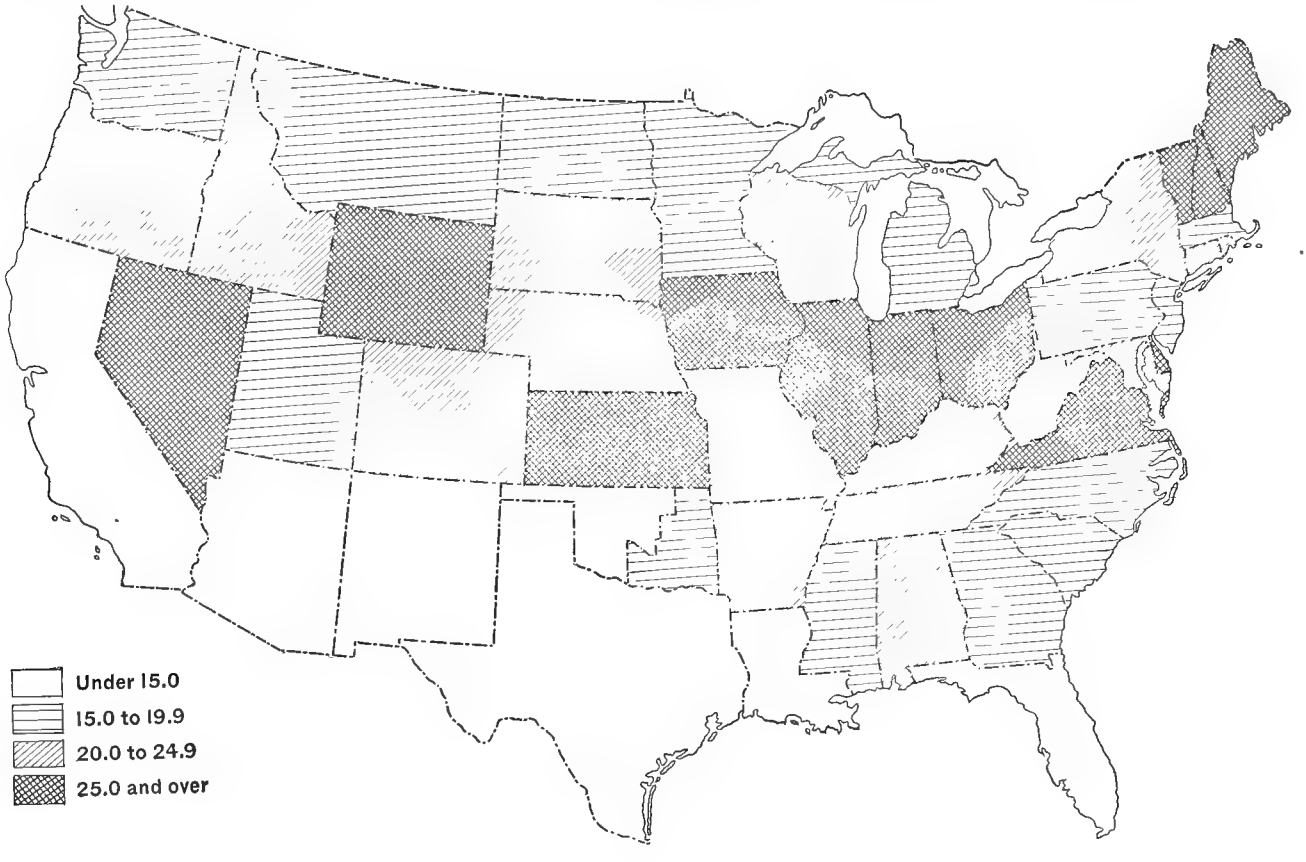
The percentage of emigration from New England and from the Southern North Atlantic states increased from 1850 to 1860, remained nearly stationary between 1860 and 1870, and after 1870 steadily declined. There has been a marked decline in the emigration from New England to the section of country which lies between that division and the Mississippi river—comprising the Southern North Atlantic and Eastern North Central divisions. In 1850 the proportion of the natives of New England residing in this section was 1,448 in 10,000 (see Table xxxiv, page 316), or 14.48 per cent, which represented more than seven-eighths of the total emigration (16.1 per cent) from that division; in 1900 the proportion was only 683 in 10,000, or 6.83 per cent, representing not much more than one-half of the total emigration. Similarly, the proportion of the natives of the Southern North Atlantic division living in the Eastern North Central states has diminished since 1860. The proportion of the natives both of New England and of the Southern North Atlantic division living in the Western North Central states rapidly increased until 1880 and then declined, and the proportion of the natives of each of these divisions living in the Pacific states increased until 1890. The proportion of the natives of the Southern North Atlantic division migrating eastward to New England steadily increased, and was twice as great in 1900 as in 1850.

The proportion of the natives of the Eastern North Central division living in other states increased steadily from 6.3 per cent in 1850 to 18.9 per cent in 1890, and then declined to 17.5 per cent in 1900. The decline in the last decade was caused by a falling off in the per cent of emigration to the adjoining division on the west, the Western North Central.

The per cent of emigrants from each of the two South Atlantic divisions has steadily diminished during the half century covered by these statistics. In 1850, 26.5 per cent, or more than one-fourth, of the free population born in the Northern South Atlantic division had migrated to other divisions; in 1900 the per cent of emigration—based, of course, on the total population born in the division—was only 16.4 per cent. In the case of the Southern South Atlantic states the decrease was still more marked, the per cent declining from 25.8 in 1850 to 11.2 in 1900. Probably a part of the reduction in the per cent shown for 1870 was due to the inclusion in that year, for the first time, of what had formerly been the slave population; but the steady decline during the half century is mainly the effect of a decline in the proportion of natives of each division migrating to the South Central and the North Central states. The proportion migrating to the Atlantic states lying farther north has increased, though not enough to offset this decline. (See Table xxxiv.)

The emigrants from the Eastern South Central division constituted a diminishing proportion of the natives of that division at each successive census after that of 1860, the per cent falling off from 26.3 in that year to 17.8 in 1900. This was mainly the effect of a decline in the proportion of the natives of this division migrating to the North Central states. The proportion migrating to the Western South Central states was higher in 1900 than it was at any previous census since 1860, and the comparatively small proportion migrating to the Atlantic states showed a slow increase prior to 1890 and a marked increase in the decade 1890 to 1900.

The per cent of emigration from the Western North Central division showed comparatively little variation from 1850 to 1890, approximately 10 per cent of the natives of the division being found in other divisions at each census during that period; but in 1900 the per cent had risen to 14.8. While this increase during the last decade is apparent in the emigration to all divisions, it is most marked in the emigration to the Western South Central division, which in 1890 contained 128,495 natives of the Western North Central states, or 2.4 per cent of the total number, and in 1900, 317,732, or 4.3 per cent of the total number. The influx of population into Oklahoma doubtless includes the larger part of the increase in the emigration to this division.



There has been comparatively little emigration from the Western South Central states. In 1900 the number of emigrants constituted only 4.8 per cent of the total number of persons born in those states. The per cent was slightly larger at some of the earlier censuses.

The emigration from the Rocky Mountain and Basin and Plateau divisions can not be computed from the published statistics for censuses prior to 1870. The statistics of later censuses show a marked increase in the percentage of emigration from each of these divisions.

In 1850 the emigration from the recently settled Pacific division was naturally insignificant, less than 1 per cent of the natives of these states having emigrated. The per cent was 5.5 in both 1880 and 1890, but during the decade 1890 to 1900 it rose to 6.8.

The present tendencies indicated by this comparison of changes in the emigration from the several minor geographic divisions are in brief the following: The per cent of emigration from each division east of the Mississippi is declining; this decline dates from 1850 or 1860 for all of these divisions except the Eastern North Central, for which the decline first appeared after 1890. The per cent of emigration from each division west of the Mississippi is increasing, although for the Western South

MAP 33.—PER CENT OF THE POPULATION BORN IN EACH STATE OR TERRITORY EMIGRATING TO OTHER STATES OR TERRITORIES: 1900.

Central states the increase did not appear until after 1890, and for the Pacific states there was no change between 1880 and 1890.

Emigration by states and territories.—In Table VI the states are ranked first in the order of the per cent of total emigration, and then in the order of the per cent of emigration to noncontiguous states; Map 33 presents a classification of the states according to the per cent of total emigration.

In considering the significance of these per cents it should be remembered that, other things being equal, a state of small area will naturally have a higher proportion of emigrants than a larger state. This may account in part for the relatively large emigration from some of the small states, such as Delaware, as compared with some of the large states, such as Texas.

TABLE VI.—*Rank of states and territories with respect to per cent of emigration: 1900.*

STATE OR TERRITORY OF BIRTH.	Per cent of emigration.	Rank with respect to per cent of emigration.	Per cent of emigration to noncontiguous states.	Rank with respect to per cent of emigration to noncontiguous states.

California	9.6	48	6.7	38
Florida	9.6	49	4.9	42
Texas	9.3	50	3.0	47

As will be seen by referring to Map 33, the states from which at least one-fourth of the native population have emigrated to other parts of continental United States include the three northern New England states, Delaware, Virginia, the three states bordering on the north bank of the Ohio river, Iowa, Kansas, Wyoming, and Nevada; this group, exclusive of the three New England states, forms an irregular and broken belt extending east and west across the middle portion of the country. The states of least emigration are all on the southern boundary, with the exception of West Virginia and Oklahoma. The states along the northern boundary to the west of New York are all (except Wisconsin and Idaho, which are hardly border states) in the group next to that of least emigration.[1] The relatively low per cent of emigration for border states, as compared with that for states in the interior, is doubtless due in part to the fact that in the former case the possibility of emigration to other states is cut off in one or more directions, while in the latter case it is open in all directions.

A comparison of the parallel columns in Table VI reveals some wide differences between the rank of states in the per cent of total emigration and their rank in the per cent of emigration to noncontiguous states, making it evident that the relative importance of many states as centers of emigration is materially diminished by the elimination of the short distance or border emigration. Nevada, which is first in per cent of total emigration, is fourteenth in per cent of emigration to noncontiguous states, and New Hampshire, which is fourth according to the former criterion, is nineteenth according to the latter. Even more marked is the reduction in rank of Delaware, from sixth to thirty-sixth; of Oregon, from twenty-fourth to forty-fourth; of Arkansas, from twenty-fifth to forty-fifth; and of Indian Territory, from twenty-ninth to forty-ninth. Of course, on the other hand, many states are advanced in rank by a comparison which disregards the short distance migration. The District of Columbia, seventeenth in per cent of total emigration, is sixth in per cent of emigration to noncontiguous states; Colorado advances from twentieth to ninth; New York, from twenty-third to twelfth; Montana, from thirty-first to eleventh. About one-half of the exceptionally large emigration from Maine to noncontiguous states represents emigration to Massachusetts; but even if that emigration is excluded, the reduced per cent, representing emigration to all noncontiguous states except Massachusetts, is still comparatively high, being 13.1.

Increase in the per cent of emigration from states and territories.—Table VII shows the per cent of emigration from each state, territory, and geographic division at each census from 1850 to 1900, and Maps 34 to 38 show for the several decades the states and territories for which the per cent of emigration increased.

[1] Doubtless there is a considerable emigration to Canada from these states along the northern boundary. In the Canadian census of 1901 the total population reported as born in the United States was 127,899; this population is not distributed by state of birth, however, and it is therefore impossible to ascertain the number emigrating from each state.

TABLE VII.—*Per cent of emigrants in the population born in each state, territory, or geographic division and living in continental United States: 1850 to 1900.*

[1] Per cent for the total area covered by Virginia and West Virginia, 23.0.
[2] Per cent for the total area covered by North Dakota and South Dakota, 13.8.

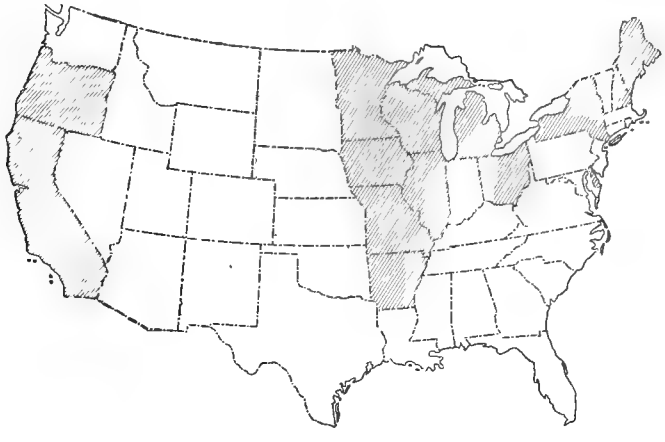
The figures here given for the individual states and territories include the migration to other states in the same geographic division as well as that to other geographic divisions; the figures for the divisions, however, cover only the migration to other divisions. Accordingly the per cent of emigration for a state is almost invariably higher than that for the division of which the state forms a part.

For six of the North Atlantic states the per cent of emigration was higher in 1860 than in 1850, the three states for which this was not the case being Rhode Island, Connecticut, and New Jersey. But the year 1860 apparently represents the high-water mark for emigration from this section. In 1870 the only states showing an increase were Maine, New Hampshire, and New York. For New Hampshire the per cent showed a still further advance in 1880, but none after that; the per cent for Maine, however, continued to increase at each successive census, and was accordingly higher in 1900 than ever before.

For all the Eastern North Central states the per cent of emigration increased until 1870, and for all except Ohio the increase continued until 1890. But only Michigan showed an increase from 1890 to 1900.

There has been no period of general increase in the per cent of emigration from the South Atlantic states. Up to 1890 decreases were the rule. Between 1890 and 1900 an increase was shown for the states along the northern border—Delaware, Maryland, District of Columbia, and West Virginia—and for Georgia and Florida.

For all the Eastern South Central states the per cent of emigration was higher in 1860 than in 1850, but from 1860 until 1890 it steadily declined. In 1900 there was an increase in the per cents for Alabama and Mississippi.



For the three Western North Central states bordering on the Mississippi river there has been an uninterrupted increase in the per cent of emigration throughout the period covered by these statistics. For the other Western North Central states and for the Western South Central states decreases were the rule prior to 1890. But between 1890 and 1900 there was an increase throughout the two western Central divisions, except for North Dakota and Oklahoma.

For the Western states there was a general increase in the per cent of emigration between 1890 and 1900, and for some of them an increase also in one or both of the two preceding decades. California and Oregon are the only states in the Western division for which there are any statistics going farther back than 1870; both these states show an uninterrupted increase in the per cent of emigration during the period covered by the statistics 1850 to 1900 for California and 1860 to 1900 for Oregon.

IMMIGRATION OF NATIVE POPULATION.

Considered as a constituent part of the total population born in a given division, persons born in that division and residing in another are emigrants; considered as a constituent part of the total population of the division in which they reside, they are immigrants. In the preceding pages interstate migrants have been treated as emigrants; the discussion was mainly an analysis and comparison of the emigration from different divisions or states and territories, the importance of the emigration being measured by the per cent which the number of emigrants forms of the total population born in the specified division, state, or territory. In this

section the other standpoint will be adopted, the native population living in each state, territory, or geographic division being distributed by division of birth, and the importance of the immigration being measured by the per cent which the native immigrant population forms either of the total native population or of the total population of the state, territory, or division.

Proportion of immigrants in the native population. The following table shows, for 1900, what proportion of the population of each geographic division born in continental United States was born outside the division—that is, consisted of native immigrants:

TABLE VIII.—*Number and per cent of immigrants in the population of each main and minor geographic division born in continental United States: 1900.*

GEOGRAPHIC DIVISION OF RESIDENCE.	POPULATION BORN IN CONTINENTAL UNITED STATES.[1]			
	Total.	Born in the specified division.	Born in other divisions (immigrants).	
			Number.	Per cent.
North Atlantic division	16,209,476	15,577,501	631,975	3.9
New England	4,119,509	3,811,295	308,214	7.5
Southern North Atlantic	12,089,967	11,370,057	719,910	6.0
South Atlantic division	10,211,017	9,789,389	421,628	4.1
Northern South Atlantic	4,286,585	3,941,470	345,115	8.1
Southern South Atlantic	5,924,432	5,726,899	197,533	3.3
North Central division	22,082,282	19,744,556	2,337,726	10.6
Eastern North Central	13,305,007	11,687,407	1,617,600	12.2
Western North Central	8,777,275	6,346,803	2,430,472	27.7
South Central division	13,689,353	12,284,542	1,404,811	10.3
Eastern South Central	7,444,534	6,842,958	601,576	8.1
Western South Central	6,244,819	4,624,297	1,620,522	26.0
Western division	3,210,639	1,841,682	1,368,957	42.6
Rocky Mountain	1,009,507	451,799	557,708	55.2
Basin and Plateau	351,962	259,461	92,501	26.3
Pacific	1,849,170	1,024,898	824,272	44.6

[1] Exclusive of population born in the United States, state or territory not specified.

Naturally the native immigrants form a much larger per cent of the total native population in the newly settled regions of the West than in the older communities of the East. Of the total population of the Western division born in continental United States, 42.6 per cent, or more than two-fifths, were born outside of that division; while in each of the two Atlantic divisions the proportion is only about 4 per cent, or one twenty-fifth. In each of the two Central divisions it is about one-tenth. Of the minor divisions, the one showing the highest per cent of native immigrants is the Rocky Mountain, and the one showing the lowest is the Southern South Atlantic.

An inspection of Table XXIX (pages 310, 311) shows that in none of the states east of the Mississippi except Rhode Island, New Jersey, District of Columbia, and Florida did the native immigrants in 1900 constitute more than 25 per cent, or one-fourth, of the population of the specified state born in continental United States; and that in none of the states west of the Mississippi except Louisiana, New Mexico, and Utah did they form less than 25 per cent.

Distribution of immigrants by geographic division of birth.—Table IX shows the per cent distribution by division of birth of the immigrant population of each division born in continental United States.

The majority of the immigrants to every division except the three Western groups were born in adjoining divisions. Over seven-tenths (70.7 per cent) of the native immigrants in New England were born in the adjoining Southern North Atlantic division—56.9 per cent of them in the single state of New York. Thus most of the migration to New England is a short distance migration. About one-eighth (12.8 per cent) of the New England immigrants come from the three southern divisions east of the Mississippi; the majority of these immigrants from the South are negroes. The immigration from the Eastern North Central states constitutes 10.2 per cent of the total, and that from states beyond the Mississippi 6.3 per cent.

TABLE IX.—PER CENT DISTRIBUTION, BY MINOR GEOGRAPHIC DIVISION OF BIRTH, OF THE NATIVE IMMIGRANT POPULATION OF EACH MINOR GEOGRAPHIC DIVISION: 1900.

MINOR GEOGRAPHIC DIVISION OF RESIDENCE.	PER CENT OF NATIVE IMMIGRANTS BORN IN—										
	New England.	Southern North Atlantic division.	Eastern North Central division.	Western North Central division.	Northern South Atlantic division.	Southern South Atlantic division. Pacific	8.7	16.7	31.3	27.2	2.8	1.4	4.6	3.1	2.3	1.9	.....

[1] Less than one-tenth of 1 per cent.

More than four-fifths of the native immigration to the Southern North Atlantic states comes from the three adjoining divisions—35.9 per cent from the Northern South Atlantic, 24.8 per cent from New England, and 23.1 per cent from the Eastern North Central. The immigration from the two remaining divisions east of the Mississippi represents 8.4 per cent of the total, and that from all divisions west of the Mississippi 7.8 per cent.

More than one-half (52.4 per cent) of the immigrants to the Eastern North Central states come from the North Atlantic states—45.1 per cent from the adjoining Southern North Atlantic division and 7.3 per cent from New England; 29.2 per cent come from southern divisions; and 17.2 per cent from the Western North Central states.

Almost three-fifths (58.9 per cent) of the native immigrants in the Western North Central states were born in the Eastern North Central division, 20.8 per cent were born in the two North Atlantic divisions, and 18.8 per cent in the southern divisions.

Each of the southern divisions except the Northern South Atlantic received the majority of its immigrants from other southern divisions, the immigration from Southern states constituting 73.8 per cent of the total immigration to the Southern South Atlantic division, 69.9 per cent of that to the Eastern South Central, and 64.6 per cent of that to the Western South Central. Of the immigration to the Northern South Atlantic only 32.2 per cent came from other southern divisions, and 60.0 per cent came from the Southern North Atlantic and Eastern North Central divisions.

The immigration to the Pacific states is exceptional in being mostly a long distance migration; the immigrants born in states east of the Mississippi constitute 65.5 per cent of the total number, 31.3 per cent coming from the Eastern North Central division and 25.4 per cent from the two North Atlantic divisions. Of the immigrants living in the Rocky Mountain and the Basin and Plateau divisions, 55.3 per cent and 50.7 per cent, respectively, came from states east of the Mississippi.

Increase of immigration: 1850 to 1900.—Table x shows the decennial increase from 1850 to 1900 in the total native immigrant population of each minor division, distributed by state or territory of residence. Accordingly the figures for the states and territories do not include immigrants from other states in the same minor division.

In each of the four minor Atlantic divisions the native immigrant population increased from 1850 or 1860 to 1900, and the increase was larger between 1890 and 1900 than in any previous decade.

TABLE X.—*Decennial increase in the native immigrant population of each minor geographic division, by states and territories: 1850 to 1900.*[1]

STATE, TERRITORY, OR MINOR GEOGRAPHIC DIVISION OF RESIDENCE.	INCREASE IN THE POPULATION BORN IN CONTINENTAL UNITED STATES OUTSIDE THE MINOR GEOGRAPHIC DIVISION OF RESIDENCE.

[1] The figures from which this table is derived are given in Table xxxv.
[2] Figures for 1860 and 1850 do not include slave population.

In each of the two North Central divisions the total number of native immigrants increased from 1850 to 1870. In the Western North Central the increase continued until 1890, the decade 1890 to 1900 showing a decrease; but in the Eastern North Central division the immigrant population decreased from 1870 to 1890 and increased from 1890 to 1900.

The immigration to the Eastern North Central division from different sections of continental United States is shown in the following table:

TABLE XI.—*Distribution by birthplace of the native immigrant population of the Eastern North Central division: 1850 to 1900.*

CENSUS.	NATIVE IMMIGRANT POPULATION OF THE EASTERN NORTH CENTRAL DIVISION BORN IN—						
	Continental United States.	North Atlantic states.	South Atlantic states.	Eastern South Central states.	Western North Central states.	Western South Central states.	Western states.
1900	1,617,600	847,880	184,939	264,763	278,551	22,150	19,317
1890	1,488,679	915,678	187,762	220,327	144,112	13,184	7,616
1880	1,663,203	1,081,086	222,421	235,603	107,355	11,396	5,342
1870	1,772,101	1,184,173	258,558	249,462	67,203	9,397	3,308
1860	[1]1,671,809	1,170,310	265,569	202,798	27,496	4,322	1,131
1850	[2]1,382,782	896,228	286,195	184,634	12,794	2,812	6
Increase:							
1890 to 1900	128,921	−67,798	−2,823	44,436	134,439	8,966	11,701

1850 to 1860	289,027	274,082	−20,626	18,164	14,702	1,510	1,125

[1] Includes 183 persons reported as born in territories, but not distributed by territory of birth.
[2] Includes 113 persons reported as born in territories, but not distributed by territory of birth.

As shown by the above table, the increase between 1890 and 1900 in the native immigrant population of the Eastern North Central division was mainly the result of an exceptionally large increase in the eastward immigration to this division from states west of the Mississippi, particularly from the Western North Central division. There was also a large increase in the northward immigration from the Eastern South Central division. But the westward immigration from the North Atlantic states declined in this as well as in the two preceding decades.

The Western North Central division is the only minor geographic division in which the total native immigrant population decreased between 1890 and 1900. Table XII shows that this was the result of a decline in the immigration from states east of the Mississippi, the immigration from states west of that river increasing during this decade by an amount greater than in any previous decade.

TABLE XII.—*Distribution by birthplace of the native immigrant population of the Western North Central division: 1850 to 1900.*

CENSUS.	NATIVE IMMIGRANT POPULATION OF THE WESTERN NORTH CENTRAL DIVISION BORN IN—					
	Continental United States.	Eastern North Central states.	Other Northern states east of the Mississippi.	Southern states east of the Mississippi.	Western South Central states.	Western states.
1900	2,430,472	1,431,795	506,756	387,717	67,378	36,826
1890	2,609,315	1,470,927	634,990	443,028	43,346	17,024
1880	2,213,754	1,130,089	603,688	434,249	36,606	9,122
1870	1,557,616	706,326	437,274	385,446	24,311	4,259
1860[1]	946,227	358,725	242,296	336,972	7,759	475
1850[1]	[2]360,576	96,708	48,527	211,891	3,435	8
Increase:						
1890 to 1900	−178,843	−39,132	−128,234	−55,311	24,032	19,802
1880 to 1890	395,561	340,838	31,302	8,779	6,740	7,902
1870 to 1880	656,138	423,763	166,414	48,803	12,295	4,863
1860 to 1870	611,389	347,601	194,978	48,474	16,552	3,784
1850 to 1860	585,651	262,017	193,769	125,081	4,324	467

[1] Exclusive of slave population.
[2] Includes 7 persons living in Minnesota territory and born in other territories, but not distributed by territory of birth.

For the Eastern South Central division Table x shows a decrease in the native immigrant population from 1850 to 1860 and from 1870 to 1890. The exceptional increase during the intervening decade, 1860 to 1870, results from the inclusion in 1870 of the emancipated negroes, who as slaves in 1860 were not included in the birthplace tables for that census. Of the negro immigrants living in this division in 1870, 36.0 per cent were natives of the Northern South Atlantic division, and most of these were probably deported southward under the slave régime, to furnish the labor supply required in the cotton belt.

Of course there is a similar defect in the comparability of the figures for the other southern divisions, producing an exaggeration of the actual increase in the native immigrant population between 1860 and 1870. Outside of the South the effect is inappreciable, the free population comprising practically the total population. But the figures for the southern divisions can not be accepted as representing even approximately the increase between 1860 and 1870 in the total immigrant population.

The following statement presents the results obtained by subtracting the immigrant negro population of each southern division in 1870 from the total immigrant population, and comparing the remainder with the free immigrant population in 1860, so as to show the increase in the number of immigrants exclusive of slaves in 1860 and of negroes in 1870.

MINOR GEOGRAPHIC DIVISION OF RESIDENCE.	POPULATION LIVING IN SPECIFIED DIVISION AND BORN IN OTHER DIVISIONS (IMMIGRANTS), EXCLUSIVE OF NEGROES IN 1870 AND OF SLAVES IN 1860.		
	1870	1860	Increase, 1860 to 1870.
Northern South Atlantic	131,396	97,846	33,550
Southern South Atlantic	60,486	54,932	5,554
Eastern South Central	415,249	490,288	−75,039
Western South Central	453,899	466,483	−12,584

This statement shows that if the negroes are excluded from the figures for 1870, as they are practically from those for 1860, the increase in the number of native immigrants for the Northern South Atlantic division, shown in Table x, is considerably reduced, that for the Southern South Atlantic is very much reduced, that for the Western South Central becomes a small decrease, and that for the Eastern South Central becomes a large decrease.

For the Western South Central division Table x shows an increase during each decade in the number of native immigrants. The exceptionally large increase during the decade 1890 to 1900 was due mainly to the large immigration to Oklahoma during that decade, and to the inclusion in 1900, for the first time, of the immigrant population of Indian Territory. The birthplace statistics for this division prior to 1890 include the states of Louisiana, Arkansas, and Texas only, and for this area the amount of increase has steadily declined since 1880. The growth of the immigration to this division from different sections of continental United States is shown in Table XIII. The slight but conspicuous decline between 1860 and 1870 in the immigrant population born in the Northern states east of the Mississippi is probably attributable to the influence of the Civil War in checking immigration from that section.

TABLE XIII.—*Distribution by birthplace of the native immigrant population of the Western South Central division: 1850 to 1900.*

CENSUS.	NATIVE IMMIGRANT POPULATION OF THE WESTERN SOUTH CENTRAL DIVISION BORN IN—				
	Continental United States.	Northern states east of the Mississippi.	Southern states east of the Mississippi.	Western North Central states.	Western states.
1900	1,620,522	242,678	1,048,209	317,732	11,903
1890	1,186,989	151,664	902,375	128,495	4,155
1880	1,005,884	102,447	815,935	85,027	2,475
1870	705,109	44,099	620,044	40,460	506
1860[1]	[2]466,183	45,629	396,804	23,459	165
1850[1]	[3]233,215	32,794	188,771	11,619	7
Increase:					
1890 to 1900	433,533	91,014	145,834	189,237	7,448
1880 to 1890	181,105	49,217	86,440	43,468	1,980
1870 to 1880	300,775	58,348	195,891	44,567	1,969
1860 to 1870	238,626	−1,530	223,240	17,001	341
1850 to 1860	233,268	12,835	208,033	11,840	158

[1] Exclusive of slave population.
[2] Includes 426 persons reported as born in territories, but not distributed by territory of birth.
[3] Includes 24 persons reported as born in territories, but not distributed by territory of birth.

For each of the three Western divisions Table x shows a steady increase in the native immigrant population throughout the period covered by these statistics; and among the individual states decreases are shown only for Colorado from 1860 to 1870 and Nevada since 1880. As a result, however, of the numerous changes in the boundaries of Western states, and hence of minor divisions, the statistics presented for 1850 and 1860 are not strictly comparable with those of later censuses for any division, or for any state or territory with the exception of California from 1850 and Colorado and Oregon from 1860.

Perhaps the most striking features brought out by the above comparison are the following: The recent decline, already noted in another connection, in the migration from New England to every other minor division except the Southern North Atlantic, the Northern South Atlantic, the Western South Central, and the Pacific; the general decline in migration from Eastern states to the Eastern North Central division since 1860 or 1870, and to the Western North Central division since 1890; the almost unbroken increase, at each successive census, in the migration to each division from states farther west—an increase which was generally greater between 1890 and 1900 than during any previous decade; the increase, usually less marked between 1890 and 1900 than in some of the previous decades, in the migration to the Rocky Mountain and Pacific divisions from all other divisions, and to the Basin and Plateau division from all others except the two North Atlantic. In considering the significance of these generalizations it must be borne in mind that the term "migration" as here used means, not the number of persons migrating within a decade or other period, but the number who were migrants on a given date, namely, the date to which the census related. Accordingly an increase in migration means an increase in that number, and does not necessarily involve an increase in the rate of migration—that is, in the number migrating decennially.

NET MIGRATION OF NATIVE POPULATION.

Table XXX (page 312) shows the net gain or loss through migration to and from each state or territory and each geographic division, as represented by the difference between the number of immigrants and the number of emigrants. The difference appears in the table as the remainder obtained by subtracting the latter number from the former. It might be termed the net immigration, or, where it is a negative quantity, the net emigration.

For each of the minor Atlantic divisions and for most of the states composing these divisions, the number of immigrants was less than the number of emigrants at every census from 1850 to 1900, indicating a loss of population through interstate migration. But

this loss appears to be due to the earlier rather than the later migration. In the case of New England the deficiency has diminished steadily since 1860, this diminution being especially marked between 1890 and 1900; in fact, for three New England states—Massachusetts, Rhode Island, and Connecticut—the number of immigrants in 1900 exceeded the number of emigrants, the earlier deficit being replaced by a surplus. Two of the three other Atlantic divisions show a similar though less marked tendency toward a reduction in the deficit resulting from interstate migration. For the remaining Atlantic division, the Southern South Atlantic, the deficiency in 1900 was slightly greater than in 1890, but less than in 1880 and 1870.

In 1850 the Eastern North Central division showed a net gain of over a million inhabitants through interstate migration. At each succeeding census the net gain diminished in amount, until, in 1890, it gave place to a deficit, which was followed by an increased deficit in 1900.

In the Western North Central division the excess of the number of immigrants over the number of emigrants steadily increased, although by diminishing amounts, until 1890, and decreased in the ensuing decade.

In the Eastern South Central division the net result of interstate migration has been a loss, which has steadily increased in amount since its first appearance, in 1860.

In the Western South Central division the net immigration has increased by continually increasing amounts. But much of the increase in the last decade was produced by the inclusion in 1900 of the immigration to Indian Territory, which was not included in the figures for previous censuses. When the figures for Indian Territory are excluded, the period of greatest increase for this division is 1870 to 1880. The total net immigration to the three Western South Central states for which the figures go back to 1850, reached its maximum in 1890. But the net immigration to Texas showed a further increase in the ensuing decade, being larger in 1900 than in any previous census year.

For the Rocky Mountain and Pacific divisions the period of greatest increase in net immigration was 1880 to 1890. For the Basin and Plateau division there was little change from 1880 to 1900.

MIGRATION TO CITIES.

In continental United States.—The reports of the last two censuses give the distribution by place of birth of the population of all cities having at least 25,000 inhabitants. On the basis of this information interstate migrants may be divided into two main classes, one comprising the migrants living in cities of that size, and the other the migrants living in smaller cities and country districts. The former class represents a migration to cities, but not necessarily a migration from the country; and since birthplaces are not given by political divisions smaller than the state or territory, it is impossible to determine how much of this migration to the larger cities was in fact a migration from country districts or smaller cities, and how much was a migration from large cities in other states.

For convenience in discussing these statistics, the term "cities" will frequently be used, without qualification, to designate cities having a population of at least 25,000, the term "urban" being applied to the population in cities of that size and the term "rural" to the population in smaller cities and country districts.

In 1900 the number of interstate migrants in continental United States living in cities was 3,402,956. This number represents 25.2 per cent of the total migration within the limits of continental United States. For the resident natives (population living in the state or territory of birth) the per cent in cities was 21.4. The total migration between minor geographic divisions of continental United States was, as already stated, 9,315,423; and of this total 2,214,947, or 23.8 per cent, represented migration to cities.

The proportion living in cities for the several classes of population here referred to is given in the following table:

TABLE XIV.—*Classification as resident natives and intradivisional and interdivisional migrants, of the population born in continental United States and living in cities having a population of at least 25,000 and in smaller cities and country districts: 1900.*

LIVING IN—	POPULATION BORN AND LIVING IN CONTINENTAL UNITED STATES.[1]				
	Total.	Living in cities having a population of at least 25,000.		Living in smaller cities and country districts.	
		Number.	Per cent.	Number.	Per cent.
Continental United States.	65,402,767	14,489,700	22.2	50,913,067	77.8
State or territory of birth (resident natives)	51,891,039	11,086,744	21.4	40,804,295	78.6
Other states and territories (migrants)	13,511,728	3,402,956	25.2	10,108,772	74.8
In the same minor geographic division (intradivisional migrants)	4,196,305	1,188,009	28.3	3,008,296	71.7
In other minor geographic divisions (interdivisional migrants)	9,315,423	2,214,947	23.8	7,100,476	76.2

[1] Exclusive of population born in the United States, state or territory not specified.

From the above table it is apparent that the degree of concentration in cities is greater for migrants than for resident natives, and greater for intradivisional than for interdivisional migrants.

The latter difference, which might suggest that the tendency to concentrate in cities is greater for the immigration from neighboring states than for that from distant states, is mainly the effect of the difference in the geographical distribution of the two classes of migrants. Nearly 60 per cent of the interdivisional migrants, and only about 30 per cent of the intradivisional, are found in states and territories west of the Mississippi. It is evident, therefore, that when comparisons are made covering the entire country the

conditions prevailing west of the Mississippi (where there is a relatively small urban population) will have more influence on the total for the former class of migrants than on that for the latter. The territorial distribution of the two classes is shown by the following table:

TABLE XV.—*Per cent distribution by minor geographic division of residence of intradivisional and interdivisional migrants: 1900.*

MINOR GEOGRAPHIC DIVISION OF RESIDENCE.	PER CENT DISTRIBUTION BY DIVISION OF RESIDENCE.	
	Intradivisional migrants.[1]	Interdivisional migrants.[2]
Continental United States	100.0	100.0
New England	11.6	3.3
Southern North Atlantic	15.5	7.7
Northern South Atlantic	6.4	3.7
Southern South Atlantic	6.9	2.1
Eastern North Central	23.0	17.4
Western North Central	17.6	26.1
Eastern South Central	7.6	6.5
Western South Central	9.0	17.4
Rocky Mountain	0.6	6.0
Basin and Plateau	0.2	1.0
Pacific	1.6	8.8

[1] Persons living in the same minor geographic division as that in which they were born, but not in the same state or territory.
[2] Persons living outside the minor geographic division in which they were born.

In minor geographic divisions.—The effect of the difference in territorial distribution can be eliminated by making comparisons for the same section of country. In the following table the per cent the resident natives in each minor division living in the larger cities form of all resident natives in the same division, can be compared with the corresponding per cents for the two classes of migrants.

TABLE XVI.—*Per cent of resident natives, intradivisional migrants, and interdivisional immigrants living in cities having a population of at least 25,000, for each minor geographic division: 1900.*

MINOR GEOGRAPHIC DIVISION OF RESIDENCE.	PER CENT LIVING IN CITIES HAVING A POPULATION OF AT LEAST 25,000, FOR POPULATION BORN IN—		
	State or territory of residence (resident natives).	Other states and territories in the same minor division (intradivisional migrants).	Other minor divisions (interdivisional immigrants).
Continental United States	21.4	28.3	23.8
New England	35.5	43.0	43.4
Southern North Atlantic	43.7	53.6	59.2
Northern South Atlantic	18.4	47.8	33.9
Southern South Atlantic	3.7	11.7	11.4
Eastern North Central	22.1	28.1	30.0
Western North Central	14.7	15.8	18.9
Eastern South Central	6.9	13.9	18.4
Western South Central	8.5	3.8	5.9
Rocky Mountain	10.2	5.9	18.6
Basin and Plateau	10.8	3.7	13.9
Pacific	29.1	27.8	30.2

The Western South Central is the only division in which the per cent living in the larger cities is higher for resident natives than for either class of migrants.[1]

[1] An explanation of this is suggested on page 298.

In each of the three Western divisions the per cent for resident natives is higher than that for migrants born in the same division, but lower than that for migrants born in other divisions. In all minor divisions except the two South Atlantic,[2] the per cent in cities is greater for the latter class of migrants than for the former.

Thus, when a comparison is made between the two classes of immigrants in the same section of the country, it appears that the immigrants from distant states are more apt to locate in the larger cities than are the immigrants from other states in the same section of the country.

From contiguous and noncontiguous states.—The distinction between intradivisional and interdivisional migration does not, however, correspond very closely with that between short distance and long distance migration, because much of the interdivisional migration is a short distance or border migration between adjoining states in different divisions, and, on the other hand, a considerable part of the intradivisional migration is between states which are not contiguous, although in the same division. For the purpose of comparing the long distance and short distance migration as regards tendency to settle in the larger cities, the distinction between contiguous and noncontiguous states, already made use of in another connection, furnishes a more satisfactory basis. When that distinction is made, it is found that the per cent living in cities having at least 25,000 inhabitants is 26.3 for migrants between contiguous states and 24.2 for those between noncontiguous states. But here again the per cents derived from the totals for continental United States are affected by the difference in the geographical distribution of the two classes of migrants, a much larger proportion of the migrants between contiguous states than of those between noncontiguous states being found east of the Mississippi.

The effect of this difference in geographical distribution is eliminated in Table XVII, which makes possible a comparison between the two classes of migrants in the same state or territory. A comparison of the per cents given in this table brings out the fact that of the 37 states having cities of at least 25,000 inhabitants there are only 3—Michigan, Louisiana, and California—in which the per cent living in those cities is not higher for native immigrants than for resident natives, and only 9—Rhode Island, New Jersey, Wisconsin, Iowa, Nebraska, Kansas, Texas, Oregon, and California—in which it is not higher for immigrants from noncontiguous states than for those from contiguous states.

[2] In the case of the Northern South Atlantic division the exceptional condition is due entirely to the influence of the immigration to the District of Columbia upon the totals for this division. Since the entire District constitutes one municipality, for all classes of immigrants therein the per cent living in cities is necessarily 100. The immigration to the District from other parts of the Northern South Atlantic division forms a much larger proportion of the total migration within that division than the immigration to the District from points outside of the Northern South Atlantic division forms of the total immigration to that division; hence the figures for the District exert a much stronger influence on the total in the former case than in the latter.

TABLE XVII.—*Per cent of resident natives and of immigrants from contiguous and from noncontiguous states, living in cities having a population of at least 25,000, for each state and territory: 1900.*

STATE OR TERRITORY OF RESIDENCE.	PER CENT LIVING IN CITIES HAVING A POPULATION OF AT LEAST 25,000, FOR THE POPULATION OF THE SPECIFIED STATE OR TERRITORY BORN IN —				
	Continental United States.	The specified state or territory (resident natives).	Other states and territories (migrants).		
			Total.	Contiguous states.	Noncontiguous states.
New England states:

Nevada					
Pacific states:					
Washington	28.1	18.7	32.7	20.1	33.7
Oregon	18.5	15.7	21.1	25.2	20.5
California	34.0	34.5	33.4	34.4	33.3

This comparison, like the preceding one, points to the conclusion that the tendency to settle in the larger cities is stronger with the long distance interstate migrants than with the short distance.

It is evident, however, from a study of the statistics of birthplace, that the location of the cities in any state, while having comparatively little effect on the migration from noncontiguous states, is an important factor in determining the extent to which the immigration from contiguous states is a cityward migration. This may be illustrated by a comparison of the migration to different cities in the state of Ohio, as shown by the census of 1900. The city of Cincinnati, just across the Ohio river from Kentucky, contained 35.2 per cent of the immigrants from Kentucky to Ohio, while the city of Cleveland, having a larger population but located on the northern border of Ohio, contained only 2.3 per cent of these immigrants; on the other hand, Cleveland contained 15.7 per cent of the immigrants from Michigan, while Cincinnati contained only 2.2 per cent. Another marked contrast, showing the influence of location, is that between Cleveland and Toledo as regards the absorption of the immigration to Ohio from Michigan. Toledo, situated at the western end of Lake Erie and close to the Michigan boundary, contained 31.0 per cent of this immigration, while Cleveland, almost three times the size of Toledo but about 100 miles distant from the Michigan boundary, contained, as just stated, only 15.7 per cent.

This large immigration to a border city from an adjacent state naturally increases very much the total cityward immigration from all contiguous states, making it much larger than it would be if the city were situated in the interior of the state. The city of Columbus, in the central part of Ohio, had received hardly more than half as many immigrants from contiguous states as the city of Toledo, although the two cities had nearly the same population (Toledo, 131,822; Columbus, 125,560). The difference is due entirely to the greater immigration to Toledo from Michigan and Indiana; from each of the other three contiguous states Columbus received more immigrants than Toledo, and from noncontiguous states it received nearly as many.

If, then, all or nearly all of the larger cities of any given state are located close to the boundaries of this state, that fact would greatly increase the total immigration to these cities from contiguous states, without affecting that from noncontiguous states to anything like the same degree. Some of the 9 states in which, as pointed out above, the per cent living in cities of at least 25,000 inhabitants is greater for immigrants from contiguous states than for those from noncontiguous states, contain important border cities; and the influence of the location of these cities doubtless accounts, in part at least, for the fact that the former per cent is the larger of the two. In Rhode Island, for instance, the city of Providence is close to the boundary of Massachusetts and not very far distant from the only other contiguous state, Connecticut. In New Jersey all the cities of over 25,000, with the exception of Atlantic

City, are practically border cities, most of them lying near large centers of population in adjoining states; and all except Newark, Elizabeth, and Atlantic City receive a larger per cent of the total immigration from contiguous states than of that from noncontiguous states. The border immigration to this state is naturally—almost inevitably—an immigration to cities mainly. New York and Pennsylvania, which are not among the 9 states referred to, contain border cities of greater importance than those in New Jersey, but they also have long stretches of border territory in which there are no cities of the size here considered.

Of course the location of cities is not the only cause of the differences between states as regards the relative importance of the city residents in the two classes of immigrants which are here distinguished. California and Texas, which are included in the list of 9 states showing a higher per cent in cities for immigrants from contiguous states than for those from noncontiguous states, have no border cities; on the other hand, in Missouri, which is not in this list, all the cities of over 25,000 are border cities. It is evident, then, that there are other factors which may influence the relative size of the two per cents. It is not improbable that in such Western states as Iowa, Nebraska, Kansas, Texas, and California the opportunity for successful agriculture appeals more strongly to the migrants from the urban East than to the natives of adjoining states, which are themselves mostly agricultural in character, while for the latter class of migrants the urban centers in the states named have a stronger attraction.

Interdivisional migration.—Table XL (pages 322, 323) presents a classification of the natives of each specified division of the United States by division of residence; it distinguishes the residents in cities of at least 25,000 from those in smaller cities or country districts, and shows what proportion of the migrants to each division from each of the other divisions reside in cities of at least 25,000 inhabitants, and also what proportion of the resident natives of each division reside in cities of that size.

This table makes possible a comparison, as regards the degree of concentration in cities, between the resident natives of each division and the interdivisional migrants. It will be found, for instance, that of the 3,811,295 New Englanders by birth residing in New England in 1900, 1,387,825, or 36.4 per cent, were in cities of at least 25,000, while of the 178,322 New Englanders who had migrated to the Southern North Atlantic states, 104,866, or 58.8 per cent, were in cities of that size; of the resident natives of the Southern North Atlantic states, 44.3 per cent were in cities. Accordingly the per cent of urban residents among migrants from the New England states to the Southern North Atlantic states is higher than it is among the resident natives of either group of states.

Since this table shows the migration from each division to each of the other divisions, it presents for consideration 110 cases of interdivisional migration within the limits of continental United States. In all but 17 cases the per cent living in cities is higher for migrants than for the resident natives of the division to which they have migrated; and in all but 37 cases it is higher for migrants than for the resident natives of the division from which they have migrated. In 64 cases out of the 110, the per cent living in cities is higher for migrants than it is for the resident natives either of the division of birth or of that of residence; in only 8 cases is it lower for migrants than for the resident natives of either division. Of the 37 cases in which the per cent is lower for migrants than for the resident natives of the division of emigration, 34 represent a migration from a division with a relatively high per cent of urban population to one in which the per cent is relatively low; and in all but 5 of these 34 cases the per cent for migrants, though lower than that for the resident natives of the former division, is higher than that for the resident natives of the latter.

Thus the table establishes the fact that in the majority of cases the migrant class is concentrated in cities to a greater degree than the resident native class either of the division in which the migrants were born or of that to which they have migrated. This condition would be produced either if the tendency of resident natives of cities to migrate to other cities were stronger than that of resident natives of rural districts to migrate to other rural districts, or if the tendency of resident natives of rural districts to migrate to cities were stronger than that of resident natives of cities to migrate to rural districts. Probably both these tendencies are operative; but which one is the more influential can not be determined by any analysis of census statistics, because these statistics do not show whether the migrants were born in cities or in country districts.

Relative importance of the migrant population in city and in country.—Table XXXIX (page 321) shows that in 1900 interstate migrants constituted 23.5 per cent of the population born in continental United States and living in cities of at least 25,000 inhabitants, and 19.9 per cent of the same class of population living in smaller cities and country districts. Thus the large cities contain more interstate immigrants, in proportion to their total population born in continental United States, than do the smaller cities and country districts. This is a corollary of the fact—shown in preceding paragraphs—that the interstate migrants are concentrated in the larger cities to a greater extent than are the resident natives. But if comparison be made with the total population—that is, including foreign born as well as native—it will be found that the relative importance of the native immigrant population is slightly less in the cities than in the country. (See Table

xxxviii, page 320.) This, of course, is because of the relatively great concentration of the foreign born element in the city population, the cities of at least 25,000 containing about one-half of the total foreign born population, as compared with only about two-ninths of the native population. The result is that the native immigrants born in continental United States constitute 17.3 per cent of the total city population, and 18.0 per cent of the total country population, of continental United States.

An analysis of the total urban and rural population of continental United States with respect to birthplace is given in the following table:

BIRTHPLACE.	POPULATION OF CONTINENTAL UNITED STATES: 1900.			
	Living in cities having a population of at least 25,000.		Living in smaller cities and country districts.	
	Number.	Per cent of total.	Number.	Per cent of total.
Total	19,718,312	100.0	56,276,263	100.0
United States	14,588,031	74.0	51,065,268	90.8
Continental United States	14,489,700	73.5	50,913,067	90.5
State or territory of residence	11,086,744	56.2	40,804,295	72.5
Other states and territories	3,402,956	17.3	10,108,772	18.0
Outlying districts	1,286	(1)	1,637	(1)
At sea or abroad	24,144	0.1	43,007	0.1
State or territory not specified	72,901	0.4	107,557	0.2
Foreign countries	5,130,281	26.0	5,210,995	9.2

[1] Less than one-tenth of 1 per cent.

The composition of the urban or city population, as shown in the above table, is three parts native and one part foreign born, while that of the rural or country population is nine parts native and one part foreign born. Hardly less striking is the contrast in the proportions born in the state or territory of residence, 56.2 per cent of the city population and 72.5 per cent of the country population. If figures could be obtained showing the per cent residing in the county as well as state of birth, the contrast would probably be even more marked, for it would record the effect of the migration within the limits of the same state, which doubtless is mainly a cityward migration.

Thus this comparison of the nativity of the two classes of population indicates a much greater homogeneity of population in the country than in the city, a fact which probably accounts in part for the greater conservatism and adherence to tradition generally characteristic of rural communities.

Table xviii furnishes a comparison, by minor geographic divisions, of the composition of the total city and country population with respect to nativity.

TABLE XVIII.—*Per cent of population of cities[1] and of country districts[2] born in state or territory of residence, in other states and territories, and in foreign countries: 1900.*

MINOR GEOGRAPHIC DIVISION OF RESIDENCE.	PER CENT OF TOTAL POPULATION BORN IN—			
	United States.			
	Continental United States.		Outside continental United States, and state not specified.[3]	Foreign countries.
	State or territory of residence.	Other states and territories.

Country districts	58.0	22.2	0.4	19.4
Pacific:				
Cities	35.4	34.0	1.7	28.9
Country districts	41.7	38.2	0.7	19.4

[1] Having a population of at least 25,000.
[2] Including cities having a population of less than 25,000.
[3] Includes population born in outlying districts; population born in the United States, state or territory not specified; population born at sea under the United States flag; and American citizens born abroad.

In every division except the Western South Central, the country population includes a higher per cent of resident natives than does the city population. The exceptional feature of the Western South Central division, in which the per cent of resident natives is greater and the per cent of native immigrants smaller in city than in country, is due to the great immigration of native population to Indian Territory and Oklahoma—territories containing no cities of over 25,000. The only other division in which the per cent of native immigrants is smaller in city than in country is the Pacific. But this merely reflects the influence of the foreign born element in reducing the per cents for both classes of natives in the total city population. Compared with the native population, the native immigrant class in the Pacific division, as well as in all other divisions except the Western South Central, attains greater importance in the city than in the country.

Increase in the migration to cities. In 1890 the number of interstate migrants living in the 124 cities having at least 25,000 inhabitants, as shown in Table XIX, was 2,229,709, which was 20.1 per cent of the total number of interstate migrants; in 1900 the number living in these same cities was 3,123,340, or 23.1 per cent of the total number. The comparison indicates that the larger cities are attracting an increasing proportion of the interstate migration. The extent of the change will perhaps be still more apparent if it is pointed out that the cities having a population of at least 25,000 in 1890—which, as just stated, had received only 20.1 per cent of the total migration up to that year—absorbed 37.0 per cent of the increase in migration during the decade following. There was a similar tendency toward concentration in cities on the part of the resident natives, 17.9 per cent living in cities in 1890 and 20.2 per cent in 1900. Probably most of this increase was produced by the intrastate migration from country to city.

TABLE XIX.—*Number and per cent of resident natives and of migrants living in cities having a population of at least 25,000 in 1890, and number and per cent living in smaller cities and country districts: 1900 and 1890.*

CLASS OF POPULATION.	POPULATION BORN AND LIVING IN CONTINENTAL UNITED STATES.				
				Per cent of total.	
	Total.	In cities having a population of at least 25,000 in 1890.	In smaller cities and country districts.	In cities having a population of at least 25,000 in 1890.	In smaller cities and country districts.
Living in state or territory of birth (resident natives):					
1900	51,891,039	10,475,687	41,415,352	20.2	79.8
1890	41,871,611	7,490,560	34,381,051	17.9	82.1
Increase, 1890 to 1900	10,019,428	2,985,127	7,034,301	29.8	70.2
Living in other states and territories (migrants):					
1900	13,511,728	3,123,340	10,388,388	23.1	76.9
1890	11,094,108	2,229,709	8,864,399	20.1	79.9
Increase, 1890 to 1900	2,417,620	893,631	1,523,989	37.0	63.0

In the following table the total population born and living in continental United States in 1900 and in 1890 is divided into resident natives ("living in state or territory of birth") and migrants ("living in other states and territories"), and each of these classes is subdivided into residents in cities and residents in country districts, the relative importance of the classes thus distinguished being shown by a per cent distribution of the total.

TABLE XX.—*Distribution by birthplace and residence of the population born and living in continental United States, distinguishing resident natives and migrants living in cities having a population of at least 25,000 in 1890, and resident natives and migrants living in smaller cities and country districts: 1900 and 1890.*

CLASS OF POPULATION.	POPULATION BORN AND LIVING IN CONTINENTAL UNITED STATES.			
	1900		1890	
	Number.	Per cent of total.	Number.	Per cent of total.
Total	65,402,767	100.0	52,965,719	100.0
Living in state or territory of birth (resident natives)	51,891,039	79.3	41,871,611	79.1
Cities having a population of at least 25,000 in 1890	10,475,687	16.0	7,490,560	14.2
Smaller cities and country districts	41,415,352	63.3	34,381,051	64.9
Living in other states and territories (migrants)	13,511,728	20.7	11,094,108	20.9
Cities having a population of at least 25,000 in 1890	3,123,340	4.8	2,229,709	4.2
Smaller cities and country districts	10,388,388	15.9	8,864,399	16.7

It has already been shown that between 1890 and 1900 the per cent which migrants form of the total population born and living in continental United States decreased from 20.9 to 20.7. The above table shows that this change was due entirely to a decrease from 16.7 to 15.9 in the per cent of migration to the smaller cities and country districts—the per cent of migration to cities with more than 25,000 inhabitants in 1890 having increased during the decade from 4.2 to 4.8. Thus the character of interstate migration, in this respect, is slowly changing. The movement of population toward rural sections and smaller cities, so far as it can be measured by interstate migration, is being retarded, while the movement toward larger cities is acquiring greater importance, indicating that the attraction of cities as centers of immigration is increasing, while that of country districts is diminishing.

The above table shows also that the relative importance, in the total native population, of each class of country population—the resident natives as well as the native immigrants—was less in 1900 than in 1890, while the opposite was true of each class of city population. It follows, of course, that each class of country population increased more slowly and each class of city population more rapidly than the total native population.

The actual per cents of increase were as follows:

CLASS OF POPULATION.	Per cent of increase, 1890 to 1900.
Population born and living in continental United States	23.5
Living in cities having a population of at least 25,000 in 1890	39.9
Born in state or territory of residence (resident natives)	39.9
Born in other states and territories (immigrants)	40.1
Living in smaller cities and country districts	19.8
Born in state or territory of residence (resident natives)	20.5
Born in other states and territories (immigrants)	17.2

A comparison of these per cents brings out an additional fact which is of interest: In the larger cities the native immigrant class increased somewhat more rapidly than did the resident natives; that is to say, in these cities the growth of the native immigrant population, resulting from interstate migration, rather more than kept pace with the growth of the resident native population, resulting from the excess of births over deaths and from intrastate migration. In the smaller cities and country districts, on the other hand, the native immigrant population did not increase as fast as the resident native population. As a result of this difference, the per cent of migrants in the native country population decreased from 20.5 to 20.1, while the per cent in the native city population showed a slight increase—from 22.9 to 23.0.

TABLE XXI.—*City and country population born and living in continental United States, classified as resident natives and immigrants: 1900 and 1890.*

LIVING IN—	POPULATION BORN AND LIVING IN CONTINENTAL UNITED STATES.				
	Total.	Born in state or territory of residence (resident natives).		Born in other states and territories (immigrants).	
		Number.	Per cent.	Number.	Per cent.
Cities having a population of at least 25,000 in 1890:					
1900	13,599,027	10,175,687	77.0	3,123,340	23.0
1890	9,720,269	7,490,560	77.1	2,229,709	22.9
Smaller cities and country districts:					
1900	51,803,740	41,415,352	79.9	10,288,388	20.1
1890	43,245,150	34,381,051	79.5	8,864,399	20.5

In the following table the native immigrant population in city and in country is subdivided into population born in contiguous states and population born in noncontiguous states—the first representing the short distance migration, the second the long distance.

TABLE XXII.—MIGRANT POPULATION DISTRIBUTED BY RESIDENCE (CITY OR COUNTRY) AND BY BIRTHPLACE (CONTIGUOUS OR NONCONTIGUOUS STATES): 1900 AND 1890.

CLASS OF POPULATION.	MIGRANT POPULATION BORN AND LIVING IN CONTINENTAL UNITED STATES.						
	1900		1890		Increase, 1890 to 1900.		Per cent of increase, 1890 to 1900.
	Number.	Per cent of total.	Number.	Per cent of total.	Amount.	Per cent of total.	
Total	13,511,728	100.0	11,094,108	100.0	2,417,620	100.0	21.8
Living in cities having a population of at least 25,000 in 1890	3,123,340	23.1	2,229,709	20.1	893,631	37.0	40.1
Born in contiguous states	1,517,596	11.2	1,014,386	9.1	503,210	20.8	49.6
Born in noncontiguous states	1,605,744	11.9	1,215,323	11.0	390,421	16.2	32.1
Living in smaller cities and country districts	10,388,388	76.9	8,864,399	79.9	1,523,989	63.0	17.2
Born in contiguous states	4,740,081	35.1	3,606,081	32.5	1,134,000	46.9	31.4
Born in noncontiguous states	5,648,307	41.8	5,258,318	47.4	389,989	16.1	7.4

The increase already noted in the relative importance of the cityward migration is apparent in both these classes of migrants, but is more marked for the short distance migration, which, as shown in the last column of the table, increased 49.6 per cent, while the long distance migration increased only 32.1 per cent.

The decline in the relative importance of the countryward migration is apparent only in the long distance migration, which constituted 47.4 per cent of the total migration in 1890 and 41.8 per cent in 1900, while the per cent representing the short distance countryward migration increased from 32.5 in 1890 to 35.1 in 1900.

The relatively small increase in the long distance countryward migration is shown by a comparison of the per cents in the last column. The change that is taking place is further illustrated by the fact that this class of migrants, which constituted 47.4 per cent of the total migrant population in 1890, included only 16.1 per cent of the increase in that population between 1890 and 1900.

The change may be localized by the comparison presented in Table XXIII, which shows, for each state, territory, and minor geographic division, the increase or decrease between 1890 and 1900 in the native immigrant population in cities and in country districts, distinguishing the immigrants born in other states or territories in the same minor division from those born in other minor divisions. While this distinction is not the same as that between contiguous and noncontiguous states, adopted in the preceding paragraphs, the interdivisional migration includes all the migration between different sections of the country, while the intradivisional migration is mostly between states that are either contiguous or not widely separated.

TABLE XXIII.—INCREASE BETWEEN 1890 AND 1900 IN THE NUMBER OF RESIDENT NATIVES, AND OF INTRA-DIVISIONAL AND INTERDIVISIONAL MIGRANTS, LIVING IN CITIES HAVING A POPULATION OF AT LEAST 25,000 AND IN SMALLER CITIES AND COUNTRY DISTRICTS.

STATE, TERRITORY, OR MINOR GEOGRAPHIC DIVISION OF RESIDENCE.	INCREASE IN POPULATION BORN IN CONTINENTAL UNITED STATES: 1890 TO 1900.									
	Living in cities having a population of at least 25,000 in 1890.					Living in smaller cities and country districts.				
	Born in—					Born in—				
			Other states and territories (immigrants).					Other states and territories (immigrants).

An inspection of the figures in the fifth column of Table XXIII reveals the fact that the number of interdivisional immigrants living in cities having a population of at least 25,000 in 1890 increased between 1890 and 1900 in every minor division, and in all but two of the states containing cities of that size. But the last column shows that in the smaller cities and country districts this class of population decreased in both of the North Central divisions and in several states outside of these divisions. This decrease undoubtedly accounts, in the main, for the relatively slow increase in the total countryward migration between noncontiguous states. (See Table XXII, page 301.)

A decrease in the native immigrant population living in the smaller cities and country districts of any geographic division means, of course, that the more recent immigration has not been sufficient to make good the losses in this class of population resulting from deaths and from remigration either to the larger cities in the same division or to other divisions; therefore a decline in immigrant population does not necessarily involve any decline in the rate of immigration, but may result from an increase in the number of immigrants dying or emigrating, without any falling off in the number of persons annually immigrating.[1]

It is extremely improbable, however, that the large decrease in the native immigrant population of the smaller cities and country districts of the North Central divisions has all been brought about in this way; it is safe to assume, rather, that it represents mainly the effect of an actual decline in the influx of immigrants. The western farm—in this portion of the West at least—is not the factor that it once was in attracting immigration from the East. This is a natural, almost an inevitable, result of the fact that most of the good farming land has already been brought under cultivation. So far as that is the case, further immigration to distinctively agricultural districts can take place only as the cultivated farms are vacated by population already there, or are subdivided into smaller farms.

It is probably true, in general, that in the settlement of agricultural districts a point is reached beyond which any considerable growth of agricultural population is possible only if there is a change to more intensive forms of agriculture, which permit the splitting up of the existing farms. If there is no such change, the further growth of population must consist in the development of urban or nonagricultural communities. In cities, on the other hand, the growth of population is not restricted by the necessity for land as an instrument of production; and the requirements for land as building space impose practically no limit upon expansion, and therefore none upon immigration.

In the Eastern North Central division the decrease in the immigrant population living in the smaller cities and country districts, shown in Table XXIII, was comparatively small, and was confined to two states—Ohio and Michigan. In the Western North Central division, on the other hand, the decrease was large, and was common to all the states in the division except Minnesota and North Dakota. It might seem that this decline in immigrant population, if attributable to the fact that the agricultural lands have been taken up, should be more marked in the eastern division, which is the older of the two. While any explanation must be largely conjectural, it may be noted that in the eastern division the communities comprised in the classification "smaller cities and country districts" are not so predominantly rural, and therefore the migration to these communities is probably not so exclusively a migration to agricultural districts, as in the case of the western division.

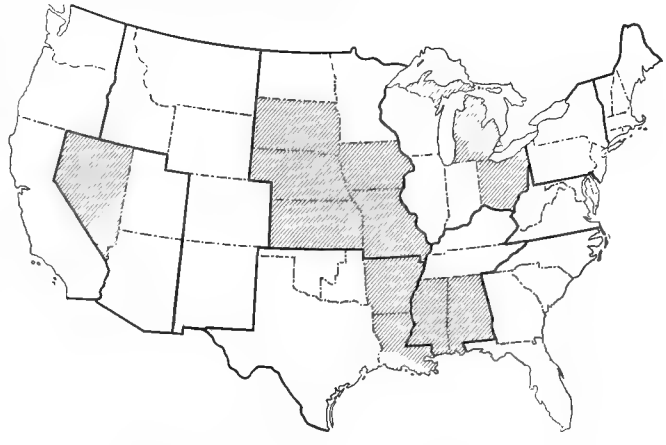
It seems probable that in the development of a new agricultural section of the country the growth of the immigrant population would commonly pass through three periods: First, a period of rapid growth following the first settlement of the country; second, a period of decline due to the fact that all the most easily available land has been taken possession of and immigration thereby checked; and third, a second period of growth, probably slower than the first, and representing mainly a migration to the new cities which appear upon the establishment and development of manufactures, trade, and commerce. Reference to Table x would suggest that in the Eastern North Central division and in most of the states comprising that division the native immigrant population has passed through the period of decline and is entering upon the second period of growth, while in the newer Western North Central division it has completed the first period of rapid growth and is in the period of decline. The diminishing increase of immigrant population appearing in many of the states farther west is, perhaps, an indication that these states are just passing out of the first period of growth. But while this hypothesis may represent a typical development, it is not to be expected that the three periods can be distinguished in all cases. The last period may follow so close on the first that there is no intermediate period of decline; or the second period, instead of being an actual decline, may be a period of relatively slow growth.

The following table, in which the increase or decrease in the native immigrant population of the Eastern North Central division is given by minor geographic division of birth, shows that the decrease noted in the number

[1] As the immigrant population increases, the number of deaths per annum also increases; and if the annual additions resulting from new immigration do not increase, but remain constant, the net gain representing the increase in immigrant population will steadily become smaller, and sooner or later a point will be reached when the losses by death approximate the additions by immigration. If the death rate then remains constant, and there is no emigration of immigrants, this condition of equilibrium may continue indefinitely, the immigrant population neither increasing nor decreasing. If, however, the death rate of the immigrant population increases—an assumption which is not improbable, in view of the fact that for a time at least the average age will increase—this population may actually decrease even without any emigration or any falling off in the number of persons annually immigrating.

of immigrants to this division living in country districts and smaller cities was the result of a decline in the number of immigrants of this class coming from the Atlantic divisions, the number born in other divisions having increased.

MINOR GEOGRAPHIC DIVISION OF BIRTH.	INCREASE, 1890 TO 1900, IN THE NUMBER OF IMMIGRANTS TO THE EASTERN NORTH CENTRAL DIVISION LIVING IN—	
	Cities having a population of at least 25,000 in 1890.	Smaller cities and country districts.
Total	135,686	−6,765
New England	2,020	26,297
Southern North Atlantic	37,846	−81,367
Northern South Atlantic	8,427	−11,002
Southern South Atlantic	4,188	−4,436
Western North Central	43,510	90,929
Eastern South Central	31,044	13,392
Western South Central	3,730	5,236
Rocky Mountain	2,045	3,214
Basin and Plateau	436	535
Pacific	2,440	3,031



In the Western North Central division the decrease in the class of immigrants living in smaller cities and country districts is apparent to a greater or less degree in the immigration from every other minor division east of the Mississippi, while the immigration from the North Atlantic states and the Northern South Atlantic shows a decrease also in the class living in the larger cities. The figures are presented in the following table:

MINOR GEOGRAPHIC DIVISION OF BIRTH.	INCREASE, 1890 TO 1900, IN THE NUMBER OF IMMIGRANTS TO THE WESTERN NORTH CENTRAL DIVISION LIVING IN—	
	Cities having a population of at least 25,000 in 1890.	Smaller cities and country districts.
Total	43,463	−222,306
New England	−7,946	−23,152
Southern North Atlantic	−10,707	−86,429
Northern South Atlantic	−1,289	−22,330
Southern South Atlantic	1,029	5,262
Eastern North Central	46,124	85,256
Eastern South Central	7,737	−35,196
Western South Central	4,698	19,334
Rocky Mountain	2,250	10,774
Basin and Plateau	340	523
Pacific	1,227	4,688

Outside the North Central divisions there are individual states which similarly show a decrease in the interdivisional immigrant population of the smaller cities and country districts. In the Eastern South Central division there are 2 such states—Alabama and Mississippi; in the Western South Central, also, there are 2—Arkansas and Louisiana; and in the Basin and Plateau states there is 1—Nevada. These, with the 2 states in the Eastern North Central division and the 5 in the Western North Central, make in all 12 states which show a decrease in the immigrant population of the smaller cities and country districts born in other minor divisions.

The states in which there was a decline between 1890 and 1900 in the immigrant population of smaller cities and country districts born in other minor geographic divisions are distinguished on the following map:

MAP 39.—*States and territories in which there was a decrease between 1890 and 1900 in the population living in country districts or in cities of less than 25,000 inhabitants and born in continental United States outside the minor geographic division of residence.*

It is probable that if figures could be obtained for the country districts alone—comprising, according to the census definition, all places having a population of less than 2,500—the decrease in interdivisional immigration would be more marked, and would cover a larger group of states than in the above comparison, in which the cities having less than 25,000 inhabitants are included with the distinctively rural areas.

MIGRATION OF NATIVE WHITES AND NATIVE NEGROES.

About one-tenth (10.4 per cent) of the total number of interstate migrants in continental United States are negroes, Indians, or Mongolians, most of these being, of course, negroes. The number of migrants in each of these classes is shown in the following table:

POPULATION BORN AND LIVING IN CONTINENTAL UNITED STATES[1] 1900.

CLASS OF POPULATION.	Total.	Living outside the state or territory of birth (migrants).	
		Number.	Per cent.
Total	65,402,767	13,511,728	20.7
White	56,375,811	12,107,238	21.5
Negro, Indian, and Mongolian	9,026,956	1,404,490	15.6
Negro	8,786,547	1,374,330	15.6
Indian and Mongolian	240,409	30,160	12.5

[1] Exclusive of population born in the United States, state or territory not specified.

The per cent of interstate migration, shown in the above table, is considerably larger for the white population than for the negro or the Indian and Mongolian.

Within the North and West the interstate migration of non-Caucasians—negroes, Indians, and Mongolians—is so inconsiderable a part of the total migration that for purposes of comparison and analysis the total may be accepted as representing a migration of white population. This is by no means true of the migration within the South or of that from the South to the North, 30.2 per cent of the former migration and 23.7 per cent of the latter being a migration of non-Caucasians, so that the facts relative to either the whites or the non-Caucasians can be ascertained and compared only by a separation of the figures.

Comparison for population born in the South.—The migration within the South and the emigration from the South are shown for whites and negroes in the following table:

TABLE XXIV.—MIGRATION OF THE WHITE AND THE NEGRO POPULATION BORN IN SOUTHERN STATES: 1900.

CLASS OF POPULATION.	POPULATION OF CONTINENTAL UNITED STATES BORN IN SOUTHERN STATES.									
	Total.	Living in state or territory of birth.		Living in other Southern states.		Living in Northern and Western states.				
						Total.		East of the Mississippi.		West of the Mississippi.	
		Number.	Per cent.	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.
White	16,055,045	12,853,985	80.1	2,070,801	12.9	1,130,259	7.0	564,823	3.5	565,436	3.5
Negro	8,216,458	6,963,850	84.7	902,957	11.0	349,651	4.3	275,595	3.4	74,056	0.9

The per cent of emigration from the South is much higher for the whites than for the negroes. In the per cent of interstate migration within the South the contrast between the races is less marked, but the whites again show the higher per cent.

Of the 349,651 negroes born in Southern states and living in Northern and Western, 168,061, or 48.1 per cent, were born in the Northern South Atlantic division, 117,380, or 33.6 per cent, being natives of the state of Virginia.[1] Of the 150,399 negroes emigrating northward from the Northern South Atlantic division, 120,864 were living in the Southern North Atlantic division—68,213 of them in the state of Pennsylvania. The number of negroes born in Virginia and living in Pennsylvania is 40,870, which is 11.4 of the total number born in the South and living in the North and West; this represents the largest migration of negroes from any Southern state to any Northern. Of the negroes born in the Eastern South Central division, 68,766 were living in the Eastern North Central and 38,274 in the Western North Central, making a total of 107,040, which represents 30.5 per cent of the total northward migration. Missouri and Kansas contain most of the southern born negroes living in the Western North Central division.

Thus the migration of negroes from the South northward is largely a short distance migration from the Northern South Atlantic division to the Southern North Atlantic, and from the Eastern South Central to the North Central. Very few of the negroes born in the states farther south than North Carolina are found in Northern states, as is evident from the following table, which shows for both whites and negroes the emigration to Northern and Western states from each Southern state.

TABLE XXV.—*Total migration of the white and the negro population from each Southern state to Northern and Western states: 1900.*

STATE, TERRITORY, OR MINOR GEOGRAPHIC DIVISION OF BIRTH.	POPULATION OF CONTINENTAL UNITED STATES BORN IN SOUTHERN STATES.

Comparison for population born in the North.—Table XXVI shows the southward emigration of northern born whites and negroes.

[1] These figures are derived from Twelfth Census, Vol. I, Table 29.

TABLE XXVI.—MIGRATION OF THE WHITE AND THE NEGRO POPULATION BORN IN NORTHERN STATES: 1900.

CLASS OF POPULATION.	POPULATION OF CONTINENTAL UNITED STATES BORN IN NORTHERN AND WESTERN STATES.											
	Total.	Living in state or territory of birth.		Living in other Northern and Western states.		Living in Southern states.					
						Total.		East of the Mississippi.		West of the Mississippi.	
		Number.	Per cent.	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.
White	40,320,766	31,414,588	77.9	7,902,194	19.6	1,003,984	2.5	449,114	1.1	554,870	1.4
Negro	570,089	448,367	78.7	91,325	16.0	30,397	5.3	17,395	3.0	13,002	2.3

The per cent of northern born negroes migrating to the South is, as would be expected, higher than the per cent for whites, while the per cent migrating to other Northern and Western states is lower. But in view of the difference in the territorial distribution of the two races and the great disparity in their numbers, this comparison of per cents can hardly be accepted as an indication of racial characteristics.

Northward migration of negroes compared with southward.—Of the 570,089 negroes born in Northern and Western states and living in continental United States, 30,397, or 5.3 per cent, had migrated to Southern states. Of course the number is much smaller than the number migrating from the South to the North; but it may be noticed that the per cent of northern born negroes migrating to the South is greater than the per cent of southern born negroes migrating to the North. (Compare Tables XXIV and XXVI.) In making such comparisons, however, it should be remembered that most of the negroes born in the North were born in states bordering on the South, while the majority of southern negroes were born in states far south, from which northern territory is not easily accessible. If the emigration northward from the border states of the South be compared with the emigration southward from the border states of the North, the difference between the per cents becomes more significant.

For the purposes of this comparison the border states of the South east of the Mississippi are regarded as comprising the Northern South Atlantic states, with Kentucky and Tennessee, although two of these states—Virginia and Tennessee—are not actually contiguous to northern territory east of the Mississippi. Of the negroes born in these states 12.3 per cent have migrated to Northern states east of the Mississippi. They form 73.4 per cent of the total negro emigration from Southern to Northern and Western states. The border states of the North included in this comparison are New Jersey, Pennsylvania, Ohio, Indiana, and Illinois. Of the negroes born in these states only 5.1 per cent have migrated to Southern states east of the Mississippi, constituting 44.1 per cent of the negro immigrants in the South from Northern and Western states. This would indicate that east of the Mississippi the tendency of the southern born negro to migrate northward is much stronger than the tendency of the northern born negro to migrate southward.

West of the Mississippi the comparison points to the opposite conclusion. Of the negroes born in Missouri and Kansas, 4.9 per cent have migrated southward, while of those born in Arkansas, Oklahoma, and Indian Territory, only 1.2 per cent have migrated northward.

Cityward migration.—Table XXVII permits a comparison between the white population and the negro, Indian, and Mongolian populations as regards the tendency to migrate to cities, showing what proportion of the interdivisional immigrants of each class of population in each division were living in cities having at least 25,000 inhabitants.

In every northern and western division, except the Basin and Plateau, the negro, Indian, and Mongolian immigrants are concentrated in cities to a much greater degree than the white immigrants. In New England, for instance, two-thirds (66.2 per cent) of the negro, Indian, and Mongolian population born in other divisions were living in cities, and only two-fifths (41.2 per cent) of the corresponding class of the white population. In the Southern North Atlantic states the contrast is not quite so marked, but in each of the North Central divisions it is even more marked. The negro, Indian, and Mongolian immigrants in these northern divisions consist mostly of negroes born in southern divisions; accordingly the figures indicate that the northward migration of negroes is largely a migration to cities, and that the tendency to settle in cities is stronger with the migrating negro than with the migrating white.

TABLE XXVII.—PROPORTION OF THE WHITE AND OF THE NEGRO, INDIAN, AND MONGOLIAN POPULATION OF EACH MINOR GEOGRAPHIC DIVISION LIVING IN CITIES HAVING A POPULATION OF AT LEAST 25,000, DISTINGUISHING THE POPULATION BORN IN THE SPECIFIED DIVISION FROM THAT BORN IN OTHER DIVISIONS: 1900.

MINOR GEOGRAPHIC DIVISION OF RESIDENCE, AND RACE.	POPULATION BORN IN—

[1] Exclusive of population born in the United States, state or territory not specified.

In two of the southern divisions, however—the Southern South Atlantic and the Eastern South Central—the per cent living in cities is considerably higher for the white immigrants than for the negro. The negro immigration to these divisions is almost entirely an immigration from other southern divisions, while a considerable proportion of the white immigrants come from the North and West.

If the migration of the negroes within the South—that is, from one Southern state to another—be compared with the corresponding migration of whites, it will be found that the contrast between the two races with regard to the tendency to locate in cities is nearly as marked as it is in the immigration to northern divisions. The comparison referred to is presented in the tabular summary given below, from which it appears that 18.5 per cent of the negroes (together with Indians and Mongolians) migrating from one Southern state to another locate in cities of at least 25,000 inhabitants, while for the same class of white migrants the per cent locating in cities of this size is only 9.6. On the other hand, the southern whites who have not migrated (resident natives) are concentrated in cities to a somewhat greater degree than are the nonmigrant negroes.

[1] Exclusive of slave population.
[2] The 110,578 persons reported in 1860 as born in the territories (Dakota, Nebraska, Colorado, New Mexico, Utah, Nevada, and Washington) are not included in this table, because they were not distributed by territory of birth.
[3] The 65,260 persons reported in 1850 as born in the territories (Minnesota, New Mexico, Utah, and Oregon) are not included in this table, because the number living outside the territory of birth was not distributed by territory of birth.
[4] Unknown.

TABLE XXIX.—NUMBER AND PROPORTION OF NATIVE IMMIGRANTS IN THE POPULATION LIVING IN EACH STATE, TERRITORY, OR GEOGRAPHIC DIVISION AND BORN IN CONTINENTAL UNITED STATES: 1850 TO 1900.

STATE, TERRITORY, OR GEOGRAPHIC DIVISION OF RESIDENCE.	POPULATION LIVING IN THE SPECIFIED STATE, TERRITORY, OR GEOGRAPHIC DIVISION AND BORN IN CONTINENTAL UNITED STATES.[1]											
	1900				1890				1880

[1] Exclusive of population born in the United States, state or territory not specified.
[2] Exclusive of slave population.
[3] In the report of the census of 1860 the population born in the territories (Dakota, Nebraska, Colorado, New Mexico, Utah, Nevada, and Washington) was not distributed by territory of birth. For the purpose of the classification required by this table, it is assumed that the population living in any territory and reported as born in territories was born in the territory of residence, and that the population living in any division containing territories and reported as born in territories was born in the division of residence.
[4] In the report of the census of 1850 the population born in the territories (Minnesota, New Mexico, Utah, and Oregon) and living outside the territory of birth was not distributed by territory of birth. For the purpose of the classification required by this table, it is assumed that the population living in states of any division containing both states and territories and reported as born in territories, was born in that division.

TABLE XXX.—NET MIGRATION AS REPRESENTED BY THE DIFFERENCE BETWEEN THE NUMBER OF IMMIGRANTS AND THE NUMBER OF EMIGRANTS: 1850 TO 1900.

STATE, TERRITORY, OR GEOGRAPHIC DIVISION.	DIFFERENCE OBTAINED BY SUBTRACTING THE NUMBER OF EMIGRANTS FROM THE NUMBER OF IMMIGRANTS.

[1] Figures for 1860 and 1850 do not include slave population.

[2] Includes 2,313 migrants living in states contiguous to territories, and reported as "born in territories;" they are assumed to have been born in territories contiguous to the state of residence, but can not be distributed by territory of birth.

[3] Includes 631 migrants living in states or territories contiguous to territories, and reported as "born in territories;" they are assumed to have been born in territories contiguous to the state or territory of residence, but can not be distributed by territory of birth.

[4] Includes 437 migrants living in states not contiguous to any territory, and reported as "born in territories;" they can not be distributed by territory of birth.

[5] Includes 318 migrants living in states or territories not contiguous to any territory, and reported as "born in territories;" they can not be distributed by territory of birth.

TABLE XXXII.—POPULATION IMMIGRATING TO EACH STATE OR TERRITORY FROM CONTIGUOUS AND FROM NON-CONTIGUOUS STATES: 1850 TO 1900.

MIGRANT POPULATION BORN AND LIVING IN CONTINENTAL UNITED STATES.[1]

STATE, TERRITORY, OR GEOGRAPHIC DIVISION OF RESIDENCE.	Living in the specified state or territory and born in contiguous states and territories.						Living in the specified state or territory and born in noncontiguous states and territories.

[1] Exclusive of population born in the United States, state or territory not specified, and of slave population in 1860 and 1850.

[2] Exclusive of population born in Dakota and Nebraska territories and living outside the Western North Central division.

[3] Including population born in territories outside the Western North Central division.

[4] Exclusive of population born in Minnesota territory and living outside the Western North Central division.

[5] Including the population living in states of the Western North Central division and born in territories outside that division.

[6] Natives of this division in 1860 and 1850 shown as "born in territories."

[7] Exclusive of population born in Washington territory and living outside the Pacific division.

[8] Including population born in territories outside the Pacific division.

[9] Exclusive of population born in Oregon territory and living outside the Pacific division.

[10] Including the population living in states of the Pacific division and born in territories outside that division.

[11] Included with the population born in the Western North Central division.

[12] Assumed to have been born in territory of residence.

[13] Included with the population born in the Pacific division.

[14] Living in Minnesota territory and born in other territories.

[15] Including 58,421 persons born and living in New Mexico territory.

[16] Including 1,381 persons born and living in Utah territory.

[17] Living in Oregon territory and born in other territories.

TABLE XXXIV.—PER 10,000 DISTRIBUTION, BY MINOR GEOGRAPHIC DIVISION OF RESIDENCE OF THE POPULATION BORN IN EACH MINOR GEOGRAPHIC DIVISION: 1850 TO 1900.

ILLITERACY.

By JOSEPH A. HILL, Ph. D.[1]

SUMMARY OF RESULTS.

The term "illiterate" includes all persons at least 10 years of age unable to write their own language, the majority of them being also unable to read.

In continental United States illiterates form about one-tenth (106.6 per 1,000) of the population at least 10 years of age.

The available statistics of illiteracy in European countries generally refer to army recruits, and are therefore fairly comparable with the statistics in the United States for native white males 21 to 24 years of age. According to this comparison the proportion of illiterates in continental United States (38 per 1,000 for the class referred to) is less than that in any European countries except Germany, Sweden and Norway, Denmark, Finland, Switzerland, and Scotland. In the Netherlands, England, and France the number per 1,000 is not much higher than in the United States; but in the remaining countries of Europe illiteracy is much more prevalent than in this country.

In continental United States since 1880 the proportion of illiteracy has declined steadily for every class of population except the foreign born whites during the decade 1880 to 1890. Apparent increases in illiteracy during two of the decades previous to 1880 are explained by the growing perfection in census methods.

In all classes of the population the proportion illiterate is less for young persons than for those advanced in life, and as a rule the illiteracy increases in each older age group above 25. This reflects the extension and improvement of elementary education, the younger generation having enjoyed better educational opportunities than the older. Among the native whites of native parentage the proportion illiterate is less at the age periods 15 to 17, 18 to 20, and 21 to 24 than at the age period 10 to 14. Apparently this decline in illiteracy between the periods of childhood and youth—most pronounced in the states and territories of the South and Southwest, where illiteracy among children is especially prevalent—is mainly the result of the fact that a considerable number of persons learn to read and write after they have passed the period of childhood.

"Belated education" probably exists outside the South and certainly appears among other classes of the population than the purely native stock. Comparison between the decrease in the total and in the illiterate native white population in corresponding age groups during the decade 1890 to 1900 indicates that "belated education" is most common in youth, continuing at a diminishing rate as the age period advances, and practically disappearing after the period of middle life.

The injurious effect of the Civil War upon elementary education—naturally most marked in the South—is indicated by the fact that among native white males in 1900 the proportion of illiteracy was much higher in the age group 45 to 54 than in the next older or next younger age groups.

Statistics of illiteracy among children are indicative of the present or recent condition of elementary education, while the statistics for older people refer to conditions that prevailed in the past.

Child illiteracy varies greatly in different sections of the country. It is less in the North and West than in the South. The South is handicapped by a smaller per capita wealth, a larger proportion of children, and separate schools for the races.

Illiteracy among children decreased between 1890 and 1900 in every main and minor geographic division and in nearly all states and territories. In 1900 it was least (3.4 per 1,000) in Nebraska, with Iowa, Oregon, Ohio, Kansas, and Indiana ranking next in order. In 1890 it was least (7.7 per 1,000) in Iowa, with Massachusetts, Ohio, Kansas, Connecticut, and Nebraska following in the order named.

Among native white children illiteracy in 1900 was least in the state of Washington, with Connecticut, District of Columbia, Utah, and Massachusetts ranking next in the order named. In 1890 it was least in Massachusetts, and the states next in order of rank were Nevada, Connecticut, Iowa, and Nebraska. The greatest gains in rank according to the literacy of native white children were made by some of the states and territories west of the Mississippi river, including Utah, Wyoming, Washington, Montana, and Oregon,

[1] A part of this chapter is derived from an unfinished study of the subject of illiteracy prepared by Dr. Frederick S. Hall, formerly employed in the Census Office.

and the greatest losses sustained by some of the Northern states east of the Mississippi, including Illinois, New Hampshire, Maine, Ohio, and New Jersey.

Illiteracy is much less prevalent in cities having at least 25,000 inhabitants than in smaller cities or country districts. The contrast is especially marked in the South and in the Rocky Mountain and Basin and Plateau divisions. It is least in the North Atlantic division, where a large proportion of the population living outside the cities of over 25,000 inhabitants live in smaller cities or suburban communities in which the school systems are not inferior to those in the larger cities.

In a comparison which includes the total population at least 10 years of age, the female sex is shown to be more illiterate than the male. But in the age period 10 to 24 years females are less illiterate than males. In 1890 the age period in which this was true extended only from 10 to 19 years. The lengthening of this period and the reduction in the excess of female over male illiteracy in the total population at least 10 years of age point to the coming of a time when females of all ages will be less illiterate than males.

The proportion of illiterates in the native white population at least 10 years of age is 46.4 per 1,000, or approximately 5 per cent; in the foreign born white population the proportion is 128.5 per 1,000, or more than 12.5 per cent. The contrast is less marked among the children in these classes of population, the illiteracy for native white children being 33.6 per 1,000 and for foreign born white children 55.8 per 1,000.

The greater concentration of the foreign born in cities gives them an advantage over the native white as regards educational opportunities. Restricting the comparison to the population living in cities with over 25,000 inhabitants, the proportion of illiteracy among native white children is reduced to 3.0 per 1,000 and that among foreign born children to only 38.8 per 1,000. In the smaller cities or country districts the proportions are, respectively, 42.6 per 1,000 and 75.5 per 1,000.

The illiteracy among non-Caucasians (negroes, Indians, and Mongolians) at least 10 years of age is 444.7 per 1,000; for non-Caucasian children, 300.7 per 1,000; for non-Caucasian children living in cities with at least 25,000 inhabitants, 77.0 per 1,000. While the proportion is always much higher than that for the corresponding class of native white population, the difference is usually less striking in comparisons restricted to a particular section of the country or to a particular community than it is in totals covering the entire country.

In continental United States the native white children of native parentage are more illiterate than the native white children of foreign parentage, the proportion for the former being 44.1 per 1,000 and for the latter 8.8 per 1,000. Further analysis shows that this contrast results chiefly from the concentration of the foreign born in cities, where the schools are better than in the country. A comparison of illiteracy by cities indicates that in the same communities such small differences as exist between the two classes of children with regard to illiteracy are for the most part in favor of the native white children of native parentage.

NATURE AND ACCURACY OF RETURNS.

Meaning of "illiterate."—Statistics of illiteracy are obtained in answer to two direct questions regarding the ability of persons at least 10 years of age to read and write their own language. In most cases persons unable to read are also unable to write, but at each census a considerable number are reported who have learned how to read but are still not able to write. There were 955,843 of these partial illiterates reported in 1900, or 15.5 per cent of the total illiterate body. In the following pages this distinction is not considered, both the total and the partial illiterates being termed "illiterates."

Accuracy of returns.—The accuracy of the information obtained is impaired in so far as the questions on the schedule are misunderstood or are falsely answered. In recent censuses the errors arising from a misunderstanding of the questions were probably very few, since explicit instructions were given to enumerators before they began their work, thus making impossible, or at least improbable, the misunderstandings that made the statistics of certain of the earlier censuses defective. Before these instructions became explicit, it is probable that many persons who were able to read and write their own language were erroneously classed as illiterate, because they were unable to read and write English. The possibility of such a misunderstanding was realized as far back as 1870.[1]

It is not easy to estimate to what extent the replies given are untruthful. Persons unable to read and write are likely to be ashamed of the fact, and may, therefore, deny it. Regarding this possibility, however, it must be observed that illiterates, who are the most ignorant class of the population, and many of whom are persons of foreign birth, stand in extreme awe of the law and of all representatives of the Government. It is probable, therefore, that they generally give correct answers to the questions regarding ability to read and write—an ability which they think they might be called upon to prove before the enumerator. Nevertheless, there is undoubtedly some falsifying regarding illiteracy; and it is probably greatest where illiteracy is least, and where for that reason the inability is most keenly felt.

INTERNATIONAL COMPARISONS.

Illiteracy in Europe.—In the United States[2] somewhat more than one-tenth (106.6 per 1,000) of the population at least 10 years of age is illiterate. The proportion seems large, but it is smaller than in most of the other countries for which statistics are available. Table 1 presents these statistics in summary form.

[1] Ninth Census, Population and Social Statistics, page 397, footnote.

[2] Throughout this discussion the United States in 1900 referred to is continental United States; i. e., that portion of the United States lying on the continent of North America south of the Canadian boundary.

TABLE I.—PROPORTION ILLITERATE IN SPECIFIED POPULATION OF COUNTRIES OR STATES IN EUROPE, AT RECENT DATES.[1]

GROUP.	Country or state.	Per 1,000 illiterate.	Year.	Sex.	Basis.	Authority.
Teutonic	German Empire	1.1	1896	Male	Army recruits	Imperial Bureau of Statistics, Berlin.
	Sweden and Norway	1.1	1893	Male	Army recruits	Hübner's Annual Tables.
	Denmark	5.4	1891	Male	Army recruits	Hübner's Annual Tables.

	Servia	860.0	1890	Male	Army recruits	Hübner's Annual Tables.
	Roumania	890.0	1892	Male	Army recruits	Hübner's Annual Tables.

[1] Derived from the Report of the United States Commissioner of Education, 1899–1900, Vol. I, page 785.

Comparable figures for the United States.—Most of the proportions presented in Table I are based upon the figures for army recruits, and it would evidently be misleading to make a comparison between such figures and the proportions shown by the United States census for the total population at least 10 years of age. In the first place, the entire colored population should be eliminated from the United States totals, and the comparison should then be restricted to males 21 to 24 years of age—this being the age class most nearly corresponding to that of army recruits in European countries. Table II shows the number and proportion illiterate in the white male population 21 to 24 years of age, classified as native and foreign born, for states and territories in 1900.

TABLE II.—NUMBER AND PROPORTION ILLITERATE IN WHITE MALE POPULATION 21 TO 24 YEARS OF AGE, CLASSIFIED BY NATIVITY, FOR STATES AND TERRITORIES: 1900.

Oregon	14,912	90	6.0	13,333	53	4.0	1,579	37	23.4
California	51,804	1,106	21.3	43,439	324	7.5	8,365	782	93.5

This table includes the entire illiterate white male population 21 to 24 years of age, but the proper class with which to compare the countries shown in the preceding table is the native white. The illiteracy of foreign born whites reflects the educational system of the country from which these persons emigrated, and, therefore, should not be allowed to affect the proportions which are to be regarded as representative of conditions in the United States. It appears that in each 1,000 of the native white males of the age specified, 38 are illiterate. The only foreign countries in Table I showing a lower proportion of illiteracy are those in the Teutonic group, Switzerland, and Scotland. England, France, and the Netherlands show a somewhat greater illiteracy, and all the remaining European countries are very much more illiterate. Thus it is evident that the effect which immigration has upon illiteracy in this country depends upon the country from which the immigrants come. For example, immigrants coming from Italy invariably increase the illiteracy of the region in which they settle, while immigrants coming from Germany to some parts of the United States might have, and probably have had, a contrary effect.

If comparison is made with the proportions for the main geographic divisions, it appears that the North Atlantic division, though the least illiterate section of the country, is nevertheless considerably more illiter-

ate than Germany, Sweden and Norway, Denmark, or Switzerland; while the South Atlantic division is far more illiterate than France, England, the Netherlands, Scotland, or Finland.

Among the 11 minor divisions the proportion of illiteracy for native white males 21 to 24 years of age is lowest in the Pacific and highest in the Southern South Atlantic. The proportion for the latter division is about as great as that for Belgium, being very much greater than the proportion for France or for the nations in the mixed Teutonic and the Teutonic groups.

Of the states and territories none has so small a proportion illiterate as Germany or Sweden and Norway. Two—Washington and Nevada—have a smaller proportion than Switzerland, and five others—Oregon, District of Columbia, Nebraska, Montana, and Utah—have proportions no greater than that for Denmark. On the other hand, there are only three states—Louisiana, North Carolina, and New Mexico—in which the proportion illiterate among native white males 21 to 24 years of age is greater than that for army recruits in Belgium.

COMPARISONS WITH EARLIER CENSUSES.

Summary of statistics, 1880 to 1900.—Statistics confirm the general impression that illiteracy has decreased in recent years. Since 1880 there has been a steady decline in the illiteracy of the total population and also in that of the native white and the negro, Indian, and Mongolian populations. For the foreign born white there was an increase of illiteracy from 1880 to 1890, which was partially offset by a decrease from 1890 to 1900.

TABLE III.—NUMBER AND PROPORTION ILLITERATE IN POPULATION AT LEAST 10 YEARS OF AGE, CLASSIFIED BY RACE AND NATIVITY, FOR CONTINENTAL UNITED STATES: 1900, 1890, AND 1880.

RACE AND NATIVITY.	POPULATION AT LEAST 10 YEARS OF AGE.			Illiterate.					
				Number.			Per 1,000.		
	1900	1890	1880	1900	1890	1880	1900	1890	1880
Total	57,949,824	47,413,559	36,761,607	6,180,069	6,324,702	6,239,958	106.6	133.4	169.7
Native white	41,236,662	33,144,187	25,785,789	1,913,611	2,065,003	2,255,460	46.4	62.3	87.5
Foreign born white	10,014,256	8,786,887	6,374,611	1,287,135	1,147,571	763,620	128.5	130.6	119.8
Negro, Indian, and Mongolian	6,698,906	5,482,485	4,601,207	2,979,323	3,112,128	3,220,878	444.7	567.6	700.0

By reference to tables[1] showing illiteracy by age groups it will be seen that the decrease in the illiteracy for the foreign born population in the decade 1890 to 1900 appears only in the youngest and the older age groups. For the age period 15 to 34, which includes most of the newly arrived immigrants, the proportion of illiteracy was higher in 1900 than in 1890. Doubtless the increase in the illiteracy of the foreign born between 1880 and 1900 reflects changes in the composition by nationality of the stream of immigration. The immigration of Teutonic races, which have a comparatively small proportion of illiterates, declined after 1882, while that of other and more illiterate races increased. Variations in the size of the total immigration may also have some influence on illiteracy statistics. During the decade ending with 1890 immigration was very large, while during most of the years between 1890 and 1900 it was much below the normal. During this last decade, moreover, those children who were under 10 years of age in 1890, and, therefore, not included in the statistics for that year, had become 10 to 19 years of age. Only 87.8 in each 1,000 of the foreign born white children of this age were illiterate in 1900, and their presence in the foreign white class had an undoubted influence in lowering its proportion of illiteracy. One further fact regarding the foreign whites will be noticed. They form the only class in which the absolute number of illiterates is increasing. The increase was, however, much less during the last decade than during the years between 1880 and 1890.

Illiteracy statistics previous to 1880.—It would be interesting, if it were possible, to trace the comparison back to 1840, when the collection of statistics of illiteracy was begun by the Census Office. The figures for 1840, 1850, and 1860 were worked over very thoroughly by a well-known educator, Dr. Edwin Leigh, of Missouri, and published in the report of the Commissioner of Education for 1870.[2] The illiteracy statistics of the censuses of 1870 and 1880 were similarly worked over by Dr. Charles Warren, statistician of the Bureau of Education, and published by that Bureau in 1884 as Circular of Information No. 3. Although the figures given in these two reports are in every way superior to the original figures in the Census volumes, they are, nevertheless, in the opinion of the writer, so inaccurate as to be worse than useless. The difficulty

[1] Twelfth Census, Vol. II, page cxiii; Eleventh Census, Population, Part II, page xliii.

[2] Annual Report of the Commissioner of Education, 1870, pages 467 to 502.

is fundamental, and arises from a misunderstanding of the census questions asked in those earlier years.

In 1840 the number of illiterates in each family was entered by the enumerator against the name of the head of that family, a method which undoubtedly led to very great understatements. This conclusion is corroborated by Governor Campbell of Virginia, who stated in his message in 1839 that "almost one-quarter part of the men applying for marriage licenses were unable to write their names,"[1] a statement which was based upon the court records of five city and borough courts and ninety-three county courts. Instead of one-fourth, the census figures show less than one-fifth illiterate in Virginia in 1840, in spite of the fact that the latter is the proportion for figures including females, a more illiterate class than males, and including also the old, a more illiterate class than those applying for marriage licenses. On account of such facts as these Horace Mann felt that it was necessary to add 30 per cent to the figures of 1840, in order to make up for the "undoubted underestimates."

Beginning with 1850 the individual entry system was used, the questions being asked regarding each member of the family. This improvement in the method of taking the census is probably the reason for an apparent increase in white illiteracy during the decade preceding the year 1850.

In 1870 another improvement in census methods was introduced, which for the first time brought the returns up to a reasonable standard of accuracy. Two questions were asked regarding each person's literacy: (1) Can he or she read? (2) Can he or she write? In the Instructions to Enumerators for that year it was explained that "it will not do to assume that because a person can read he can therefore write. Many persons who will claim to be able to read, though they really do so in a most defective manner, will frankly admit that they can not write." This indicates, what is probably the fact, that in previous censuses, where merely each person's ability to "read and write" had been ascertained, the ability to write was assumed from the ability to read, and in this way the actual illiteracy was considerably understated. The result of this greater accuracy in taking the census of 1870 is seen in a second apparent increase in the proportion of white illiteracy, an increase which can not be attributed to immigration.

These two increases in the illiteracy of the white population are the only increases between 1840 and 1900. They correspond with the only changes in the method of taking the census of illiteracy during those same years, and the conclusion is inevitable that they are apparent increases only, and are due in each case to the growing perfection in census methods.

[1] Quoted in Annual Report of the Commissioner of Education, 1870, page 468.

The census of 1870 is comparable with all succeeding censuses so far as the method of taking it is concerned; but the classification of the returns by nativity and age is not quite the same as at later censuses. For this reason comparisons in this discussion are limited to the years 1880, 1890, and 1900.

ILLITERACY, BY SEX AND AGE PERIODS.

Age periods compared.—In studying illiteracy as shown by the census of 1900, comparisons may be made between the old and the young, males and females, city and country, whites and negroes, native whites and foreign born whites, and also native whites of native parents and native whites of foreign parents. The age of a population has such a marked effect upon its illiteracy that comparisons of this kind are considered first. The following table gives, for continental United States, the illiteracy of the population at least 10 years of age, classified by race and nativity and age periods:

TABLE IV.—*Proportion illiterate in population at least 10 years of age, classified by race and nativity and age periods, for continental United States: 1900.*[1]

AGE PERIOD.	PER 1,000 ILLITERATE IN POPULATION AT LEAST 10 YEARS OF AGE: 1900.							
	Total.	Native white.		Foreign born white.	Negro.	Indian.	Chinese.	Japanese.
		Native parents.	Foreign parents.					
At least 10 years	106.6	57.2	16.4	128.5	444.7	561.6	289.6	182.1
10 to 14 years	71.5	44.1	8.8	55.8	301.3	280.5	224.9	208.8
15 to 17 years	73.9	41.4	11.7	99.2	313.5	298.7	197.8	191.7
18 to 20 years	86.0	42.1	12.3	116.5	338.9	404.9	274.5	169.7
21 to 24 years	86.1	44.0	11.8	114.1	347.4	431.5	311.2	174.8
25 to 34 years	91.3	46.4	13.4	121.3	393.1	587.8	271.2	188.9
35 to 44 years	112.2	63.6	19.7	118.9	519.7	728.9	271.5	193.8
45 to 54 years	147.5	79.9	34.0	127.1	681.0	798.9	311.6	207.9
55 to 64 years	160.5	80.2	48.1	146.9	784.2	846.3	350.8	[2]
65 years and over	198.5	106.9	80.0	192.9	853.7	891.8	391.8	[2]
Age unknown	233.3	84.2	82.5	274.8	553.9	542.1	148.0	141.6

[1] Compiled from Twelfth Census, Vol. II, Table LXVI.
[2] Per 1,000 not shown where base is less than 100.

The more important variations in illiteracy by age, as brought out by the above figures, are shown graphically for 1900 in Diagram 7, page 334.

The rise in illiteracy from lower to higher ages, shown in the table and diagram, reflects in the main the progress during the last half century in the educational advantages open to the various classes. Naturally the most striking difference between the older and younger age groups is seen in the case of the negroes.[2] Those 55 to 64 years of age in 1900 spent their years of school age under the slavery system, and it is therefore not surprising that nearly four-fifths of them were illiterate in 1900. The illiteracy line for this class traces

[2] Indians, Chinese, and Japanese are excepted because of their relatively small numbers and the peculiar conditions surrounding them.

roughly the extension of elementary education among the negroes since the Civil War.

Each of the other lines shows a rise from the lower to the higher ages. Illiteracy among the foreign born whites is very much less at the lowest two age periods than at any older period. This is a result of the fact that illiterate immigrants who reach this country as children get the benefit of the American schools, while most of the adult immigrants who are illiterate remain so.

Diagram 8,[1] page 335, shows the variations in illiteracy by age for 1890.

DIAGRAM 7.—PROPORTION ILLITERATE IN THE POPULATION AT LEAST 10 YEARS OF AGE, CLASSIFIED BY RACE AND NATIVITY AND AGE PERIODS, FOR CONTINENTAL UNITED STATES: 1900.

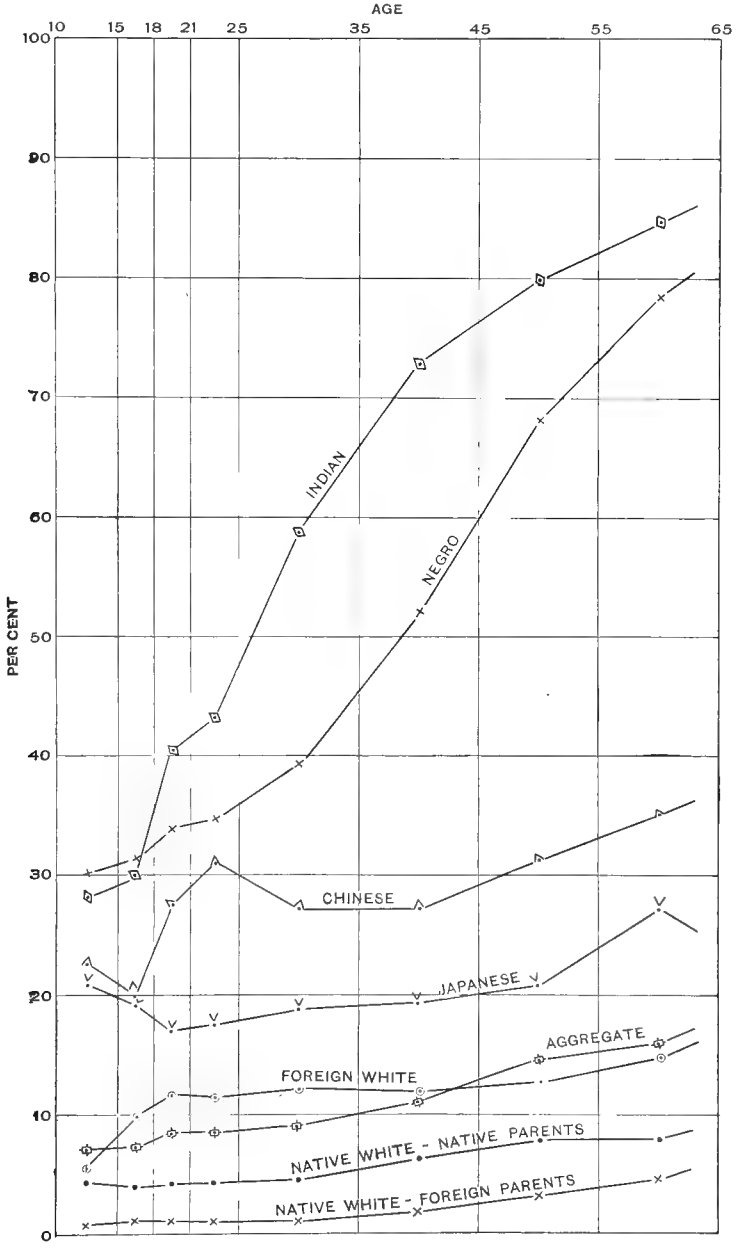

Diagram 8 is introduced in order to call attention to the similarity of results at the two censuses. Practically the same variations as shown for 1900 in Diagram 7 appear here for 1890, thus partially confirming the accuracy of the figures.

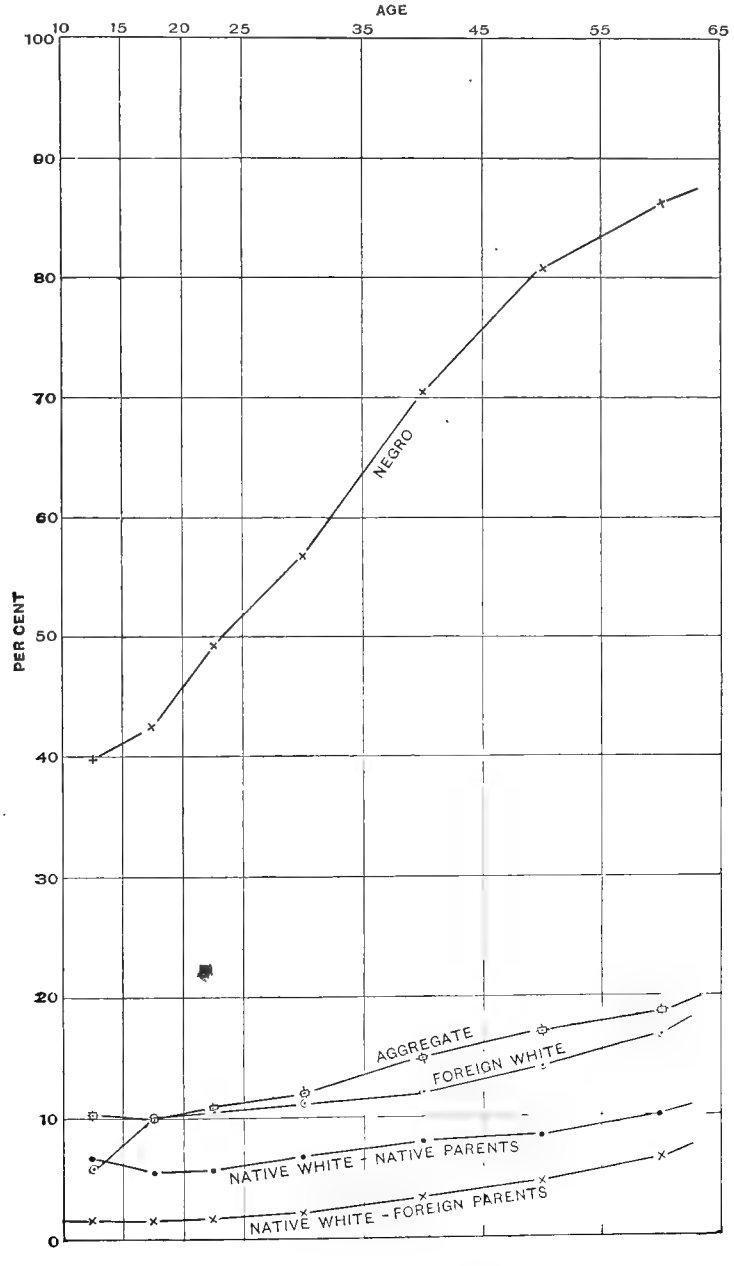
Comparison by sex and age periods.—In the total population at least 10 years of age the proportion of illiteracy is slightly higher among females than among males, being 112.2 in each 1,000 for the former and 101.4 for the latter. The excess of female illiteracy was less in 1900 than in 1890 and less in 1890 than in 1880. The change is shown by Table v.

[1] Derived from figures given in Eleventh Census, Population, Part II, pages xlii and xliii.

TABLE V.—*Proportion illiterate in male and female population at least 10 years of age and excess of female illiteracy, for continental United States: 1900, 1890, and 1880.*



CENSUS.	ILLITERATES PER 1,000.		Excess of female illiteracy.
	Males at least 10 years of age.	Females at least 10 years of age.	
1900	101.4	112.2	10.8
1890	123.5	143.8	20.3
1880	158.3	181.6	23.3

The above comparison suggests that as regards illiteracy the two sexes are approaching equality. But a comparison by age periods leads to a modification of this conclusion, indicating that the period of equality will be but transitory and will be followed by a period when the proportion of illiteracy is lower for females than for males.

The illiteracy of each sex by age groups is given in Table VI.

Inspection of this table shows that the excess of

DIAGRAM 8.—PROPORTION ILLITERATE IN THE POPULATION AT LEAST 10 YEARS OF AGE, CLASSIFIED BY RACE AND NATIVITY AND AGE PERIODS, FOR CONTINENTAL UNITED STATES: 1890.

female illiteracy is confined to the older age periods. It appears first in the age group 25 to 34, and increases as the age period advances. Under 25 it is the male sex which is the more illiterate. Thus it may be said that in the younger generation females are clearly superior to the other sex in the more general possession of ability to read and write. Among the native white population both of native and of foreign parentage this superiority continues until the age group 35 to 44 is reached, as is shown in Table VII.

Speaking with reference to the native white population, then, it appears that the generation which passed through the school period of life twenty or more years ago has a higher proportion of illiteracy for females than for males, while with the younger generation the difference is the other way. This fact indicates that under present conditions the elementary schooling of boys is more liable to be neglected than that of girls. Some probable reasons for this difference will be suggested in discussing the illiteracy of children (page 349); but it may be noted here that the conditions referred to point to the coming of a time when females of all ages will be less illiterate than males.

TABLE VI.—*Proportion illiterate in male and female population at least 10 years of age, classified by age periods, for continental United States: 1900.*

AGE PERIOD.	ILLITERATES PER 1,000: 1900.	
	Males.	Females.
At least 10 years	101.4	112.2
10 to 14 years	79.8	63.0
15 to 17 years	85.4	62.4
18 to 20 years	91.6	78.7
21 to 24 years	89.5	82.7
25 to 34 years	87.6	95.2
35 to 44 years	97.2	129.1
45 to 54 years	129.2	168.3
55 to 64 years	140.8	181.4
65 years and over	166.6	231.0
Age unknown	169.9	343.6

The inference that such a change is in progress is confirmed by the fact that the age period in which illiteracy is less common among females than among males appears to be lengthening, including more age groups in 1900 than in 1890, as may be seen by comparing Table VII, showing the illiteracy by age periods for 1900, with Table VIII, which presents the corresponding statistics for 1890.

TABLE VII.—PROPORTION ILLITERATE IN MALE AND FEMALE POPULATION AT LEAST 10 YEARS OF AGE, CLASSIFIED BY RACE AND NATIVITY AND AGE PERIODS, FOR CONTINENTAL UNITED STATES: 1900.

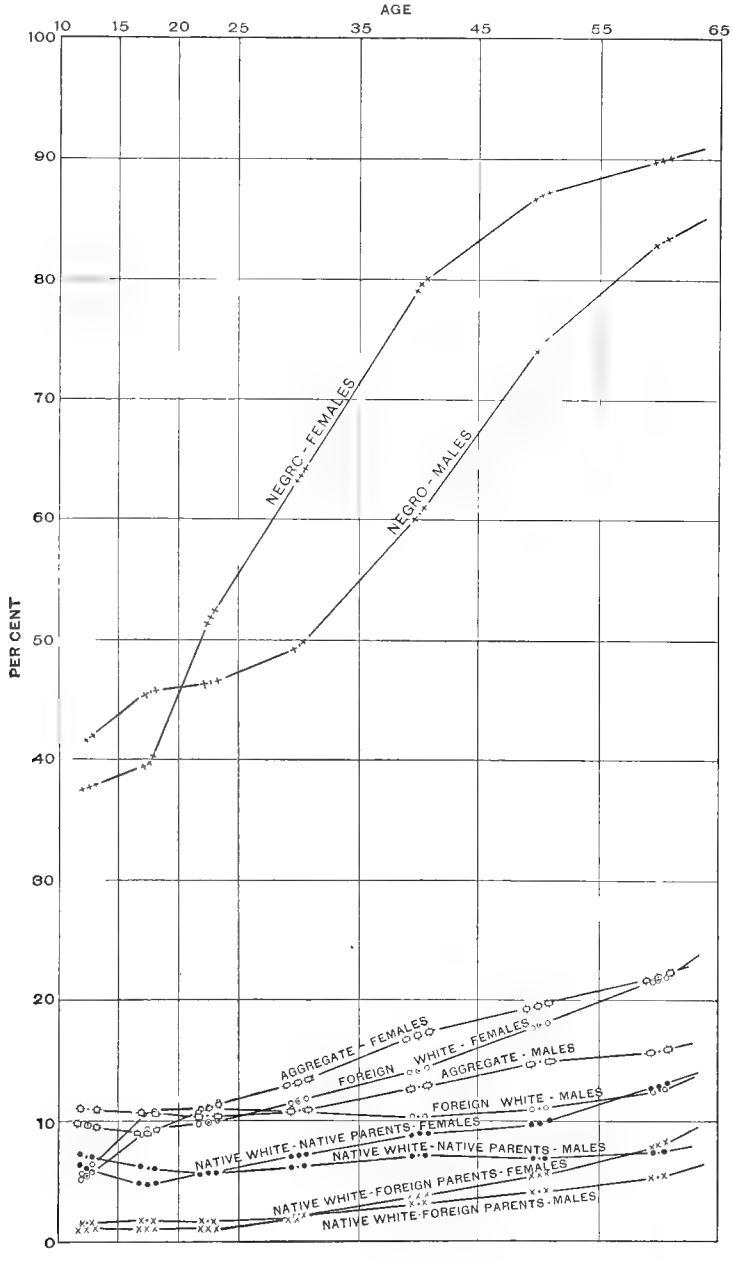
Age unknown	222.8	334.1	85.8	132.6	46.6	51.3	268.9	280.3	594.1	735.7	527.0	737.9

Although, when the figures in Tables VII and VIII are compared, the general tendency to lengthen the age period in which illiteracy is lower among females than among males is apparent, it does not appear explicitly for each class of the population. In the case of the total and of the negro population the age period is lengthened by five years, and of the native white population of native parentage, by fifteen years. But for the native white population of foreign parentage there is no change in the age period, and yet the tendency is present, as is indicated by the fact that the decrease in illiteracy is greater among females than among males. Among the foreign born whites the tendency, which is probably present among those who have been in this

DIAGRAM 9.—PROPORTION ILLITERATE IN MALE AND FEMALE POPULATION AT LEAST 10 YEARS OF AGE, CLASSIFIED BY RACE AND NATIVITY AND AGE PERIODS, FOR CONTINENTAL UNITED STATES: 1900.



country for any length of time, is obscured by the influx of large numbers of immigrants having a very high proportion of illiteracy.

The same tendency is illustrated graphically by Diagrams 9 and 10, in which the change from an excess of male illiteracy in the younger age groups to an excess of female illiteracy in the older produces an intersection of the two lines representing the illiteracy of the sexes. For each class of the population the point where the lines cross is farther to the right in the diagram for 1900 than in that for 1890.

"*Belated education.*"—One exceptional feature will be noticed about the line that represents the illiteracy of the native whites of native parents in Diagrams 7

and 8. This line falls from the age period 10 to 14 years to the age period 15 to 17 years in the 1900 diagram, and from the age period 10 to 14 years to the age period 15 to 19 years in the 1890 diagram. This means, of course, that for this class illiteracy decreases from the age period 10 to 14 years to the age period 15 to 17 or 15 to 19 years. Since the general tendency among all classes is toward a rise in illiteracy from the

DIAGRAM 10.—PROPORTION ILLITERATE IN MALE AND FEMALE POPULATION AT LEAST 10 YEARS OF AGE, CLASSIFIED BY RACE AND NATIVITY AND AGE PERIODS, FOR CONTINENTAL UNITED STATES: 1890.

lower to the higher age periods, the decline noted for native whites of native parentage during the early age periods demands special consideration.

It appears from Table VII that this exceptional decrease in illiteracy from lower to higher ages embraces more age groups for males than for females, and the following comparison is therefore confined to the native white males of native parentage:

TABLE IX.—PROPORTION ILLITERATE IN NATIVE WHITE MALE POPULATION OF NATIVE PARENTAGE, CLASSIFIED BY AGE PERIODS, FOR STATES AND TERRITORIES: 1900.

STATE OR TERRITORY.	PER 1,000 ILLITERATE IN NATIVE WHITE MALE POPULATION OF NATIVE PARENTAGE: 1900.

Upon inspection of the preceding table it appears that this exceptional decline in illiteracy from lower to higher ages is confined to the Southern South Atlantic, Eastern South Central, Western South Central, and Rocky Mountain divisions. When the same data for states and territories are considered, it is evident that the above decline is not confined to the states in those divisions nor is it manifest in each state in those divisions. The states and territories in which the decline in the proportion of illiteracy covers three or more consecutive age periods, commencing with the age period 10 to 14, are: North Carolina, South Carolina, Georgia, Florida, Tennessee, Alabama, Mississippi, Arkansas, Indian Territory, Oklahoma, Texas, and New Mexico. The additional states and territories that show a decline covering three consecutive age periods, commencing with the age period 15 to 20, are: Maine, Louisiana, Colorado, and Arizona. In no case does the decline continue beyond the age period 25 to 34, though in some instances the proportion illiterate in still later age periods remains below that for the age period 10 to 14, or 15 to 20. The fact that the states in which the decline is marked are the states showing the greatest illiteracy among children, suggests the probability that the exceptional reduction of illiteracy after the years of childhood is, in part at least, the result of a number of persons learning to read and write in later years.

It is not to be assumed, however, that this "belated education" (as it may be called for the sake of brevity) is confined to a few Southern states and to the native whites. Doubtless it is found in all of the states and among all classes, though in a less marked degree, its effect on the illiteracy line being obscured by another and usually more powerful cause—the increase of educational advantages from decade to decade. Because of this steady improvement in education, each successive generation enters the period of adult life with a lower proportion of illiteracy than the generation which preceded it, and consequently each age group as a rule has a lower per cent of illiteracy than the next older age group. But the exceptions to this rule, already noted as indicating the presence of counteracting influences, suggest that each generation may become less illiterate as it grows older, though usually remaining more illiterate than the next younger generation. This last inference is confirmed by reference to the following table, in which the illiteracy in 1900 of the native whites of native parentage, the native whites of foreign parentage, and the negroes in each specified age group may be readily compared with the illiteracy in 1890 of the same classes in the age group 10 years younger:

TABLE X.—NUMBER AND PROPORTION ILLITERATE IN THE NATIVE WHITE POPULATION OF NATIVE AND OF FOREIGN PARENTAGE AND IN THE NEGRO POPULATION, CLASSIFIED BY AGE PERIODS, FOR CONTINENTAL UNITED STATES: 1900 AND 1890.

AGE PERIOD.		NATIVE WHITE.												NEGRO.

55 to 64	45 to 54	2,170,510	174,089	80.2	2,727,152	230,423	84.5	283,331	13,638	48.1	315,982	15,189	48.1	340,863	267,312	784.2	499,679	403,634	807.8
65 and over	55 and over	1,715,226	183,428	106.9	3,162,452	358,141	113.2	141,146	11,285	80.0	209,347	17,103	81.7	261,363	223,124	853.7	480,004	422,389	880.0

In the above table every comparison but one shows a decrease from 1890 to 1900, and in that one the proportion is stationary. For example, in 1890 the number of illiterates among negroes who were 10 to 14 years of age was 398.3 per 1,000; ten years later, in 1900, the number of illiterates among negroes who were then 20 to 24 years of age was but 351.3 per 1,000.

It is evident that all persons who were 10 to 14 in 1890 had become 20 to 24 in 1900, provided they were still alive. All losses that appear when the total number of persons in a given age group in 1890 is compared with the total number in the group 10 years older in 1900 must be ascribed to deaths and emigration, chiefly to the former. The illiterate population is subject to both these losses and to an additional loss which represents the number who learned to read and write between 1890 and 1900. That the illiterate population in a given age group decreased more rapidly than the total population in the same age group, is shown by the decline in the proportion of illiteracy. But it can not be inferred that the difference is due entirely to learning to read and write, because it is

probable that ignorance and bad sanitary conditions among illiterates make the death rate higher for this class than for the total population. Moreover, the fact that illiterates are older than the rest of the population,[1] or, in other words, are concentrated to a greater degree in the older age periods and probably in the older years of each single age period, would also tend to produce a higher death rate for this class. The difference referred to between the decrease in the number of illiterates and the decrease in the total population is shown for native whites of native parentage in the following table:

TABLE XI.—DECREASE FROM 1890 TO 1900 IN TOTAL AND ILLITERATE NATIVE WHITE POPULATION OF NATIVE PARENTAGE OF SPECIFIED AGE GROUP IN 1890, FOR CONTINENTAL UNITED STATES.

NATIVE WHITE POPULATION OF NATIVE PARENTAGE.								
1900			1890			Decrease from 1890 to 1900.		
						Total.		Illiterate.
Age period.	Total.	Illiterate.	Age period.	Total.	Illiterate.	Number.	Per cent.	Number.	Per cent.
20 to 24 years	3,805,609	166,884	10 to 14 years	3,964,906	267,410	159,297	4.0	100,526	37.6
25 to 34 years	5,868,002	272,557	15 to 24 years	6,737,691	383,073	869,689	12.9	110,516	28.8
35 to 44 years	4,404,122	280,246	25 to 34 years	4,922,050	337,642	517,928	10.5	57,396	17.0
45 to 54 years	3,339,418	266,889	35 to 44 years	3,773,703	305,161	434,285	11.5	38,272	12.5
55 to 64 years	2,170,510	174,089	45 to 54 years	2,727,152	230,423	556,642	20.4	56,334	24.4
65 years and over	1,715,226	183,428	55 years and over	3,162,452	358,141	1,447,226	45.8	174,713	48.8

The above table shows that the total native white population included in the age group 10 to 14 in 1890 decreased 4.0 per cent in the ensuing ten years, while the number of illiterates in that group decreased 37.6 per cent. The relatively high per cent of decrease for the illiterates could hardly be accounted for by the difference in death rates, and doubtless represents to a large extent the reduction produced by the number that learned to read and write.

The difference between the per cents becomes less marked in each older age group, and in the groups above the age of 45 is not greater than might result from a difference in death rates, thus indicating that there is but little, if any, learning to read and write in the later period of life.

Effect of the Civil War.—One further fact of interest is revealed in the illiteracy of the native white males of native parents, as given in Table IX and indicated graphically by Diagram 9. This is the fact that their illiteracy in the age group 45 to 54 is exceptionally high—not only, as would be expected, higher than in any younger age group, but higher, also, than in the next older age group. On comparing the figures by states it will be found that this feature, appearing in the total for continental United States, is common to most of the Southern states, New York, and five New England states. Since those persons who were between 45 and 54 years of age in 1900 were between 5 and 14 when the Civil War broke out, it is evident that the illiteracy of this age group reflects the conditions that prevailed during that conflict. Naturally the effect is most marked on the population of the Southern states, but even in the North there are indications that elementary education during the war period was not as well cared for as in the previous decade.

[1] The difference in age distribution in 1890 was as follows:

NATIVE WHITE POPULATION OF NATIVE PARENTAGE: 1890.				
AGE PERIOD.	Total.		Illiterate.	
	Number	Per 1,000 distribution.	Number.	Per 1,000 distribution.
At least 10 years	25,375,766	1,000.0	1,890,723	1,000.0
10 to 14 years	3,964,906	156.2	267,410	141.4
15 to 19 years	3,552,524	140.0	198,867	105.2
20 to 24 years	3,185,167	125.5	184,206	97.4
25 to 34 years	4,922,050	194.0	337,642	178.6
35 to 44 years	3,773,703	148.7	305,161	161.4
45 to 54 years	2,727,152	107.5	230,423	121.9
55 to 64 years	1,730,312	68.2	176,118	93.1
65 years and over	1,432,140	56.4	182,023	96.3
Age unknown	87,812	3.5	8,873	4.7

CHILD ILLITERACY, 1880, 1890, AND 1900.

Summary of statistics, 1880 to 1900.—Statistics relating to the illiteracy of persons of all ages have value for certain purposes, representing, as they do, the general level of a population's illiteracy; but it is plain that they furnish no index to present-day educational advantages, or the extent to which such advantages are being used. Information of this latter character is best obtained from statistics which are confined to children from 10 to 14 years of age. Children enter the first grade of school ordinarily at the age of 6, 7, or 8 years, and it is to be expected that by the time they have reached the age of 10 they will be able to read and write. On this assumption it will be seen that the children 10 to 14 years of age in 1900 would normally have learned to read and write between the years 1892 and 1900, inclusive. Figures relating to the illiteracy of these children indicate the most recent conditions of education, and they are, therefore, the statistics most frequently used in the following pages.

Table XII gives the proportion illiterate among children 10 to 14 years of age, classified by race and nativity, for 1900, 1890, and 1880.

TABLE XII.—NUMBER AND PROPORTION ILLITERATE AMONG CHILDREN 10 TO 14 YEARS OF AGE, CLASSIFIED BY RACE AND NATIVITY, FOR CONTINENTAL UNITED STATES: 1900, 1890, AND 1880.

RACE AND NATIVITY.	CHILDREN 10 TO 14 YEARS OF AGE.								
	Total.			Illiterate.					
				Number.			Per 1,000.		
	1900	1890	1880	1900	1890	1880	1900	1890	1880
Total	8,080,234	7,033,509	5,715,186	577,649	731,688	1,131,965	71.5	104.0	198.1
White	6,959,238	5,991,972	4,880,531	240,580	316,498	579,194	34.6	52.8	118.7
Native white—native parents	4,660,390	3,964,906	(1)	205,735	267,410	(1)	44.1	67.4	.....
Native white—foreign parents	1,987,283	1,630,687	(1)	17,473	25,553	(1)	8.8	15.7	.....
Foreign born white	311,565	396,379	238,439	17,372	23,535	(1)	55.8	59.4	.....
Negro, Indian, and Mongolian	1,120,996	1,041,537	834,655	337,069	415,190	552,771	300.7	398.6	662.3
Negro	1,091,990	1,033,701	(1)	328,992	411,726	(1)	301.3	398.3	.....
Indian and Mongolian	29,006	7,836	(1)	8,077	3,464	(1)	278.5	442.1	.....

[1] Figures not available.

In 1900 the least illiterate children of any class were the native whites of foreign parentage, with 8.8 illiterate per 1,000, while the most illiterate were the negroes, with 301.3 illiterate per 1,000.

During the period 1880 to 1900 illiteracy declined among children 10 to 14 years of age, as well as among the population at least 10 years of age (page 332). The decline from 1890 to 1900 extended to all the different classes of children shown in the above table, although not to all in the same degree. It was greater among Indian and Mongolian and less among foreign born white children than among those of any other class. In fact, the decrease of 163.6 in the number of illiterates in each 1,000 of Indian and Mongolian children was so great that they have become less illiterate than negroes in the same age group; while on the other hand the decline, 3.6, for foreign born white children was so small that in 1900 they were more illiterate than native white children of native parentage. There was also a marked decrease in illiteracy among both the white and non-Caucasian children during the decade 1880 to 1890.

States and territories.—Child illiteracy varies greatly in the different parts of the country. For example, in the North Atlantic division it has almost disappeared, being less than 10 per 1,000; while in the South Atlantic division it is still large, 177.9 per 1,000, as is shown in Table XIII.

If the figures for 1900 are compared with those for 1890, it will be noticed that child illiteracy decreased in every main and minor division. In the Southern North Atlantic division the proportion of illiterates among children in 1900 was just one-half as large as it was in 1890. Only in the Pacific and the Eastern North Central states was the relative reduction greater, though the absolute decrease in some of the more illiterate divisions was very marked.

TABLE XIII.—*Number and proportion illiterate among children 10 to 14 years of age, for states and territories: 1900 and 1890.*

STATE OR TERRITORY.	CHILDREN 10 TO 14 YEARS OF AGE.

California	126,889	111,166	1,279	2,309	10.1	20.8

The table furnishes data for some interesting comparisons regarding child illiteracy in the various states. Thus in 1900 the child population of Connecticut was less illiterate than that of any other New England state; but in 1890 this distinction belonged to Massachusetts. New York, which in 1890 had a considerably higher proportion of child illiteracy than Massachusetts, has reduced its proportion almost to the Massachusetts level. Among the states of the Northern South Atlantic division Virginia shows the highest proportion of illiterate children. This is probably due to the fact that the conditions in Virginia correspond more closely to those in the states of the Southern South Atlantic and the South Central divisions than to those in the remaining states of the Northern South Atlantic division. In the Western South Central division two illiterate centers stand out prominently—Louisiana and Indian Territory. This latter area has been the home of thousands of white families who, in order to develop this fertile section, have voluntarily cut themselves off from the school privileges and educational influences which they might enjoy in other states, and the effect is apparent in the striking contrast between the illiteracy of children in this territory and in the adjoining territory of Oklahoma, which was settled by immigrants of the same sort from neighboring states, but settled under political conditions that made the establishment of public schools by the immigrant white population possible in the latter case, although impossible in the former. The high proportion of child illiteracy in Arizona and New Mexico is due chiefly to the Mexican element in those territories, and the same is true to a large degree of Texas.

The high proportion of child illiteracy in the Southern states is due partly to the large number of negro children in that section, yet on the other hand the northern population includes a large number of immigrant children—a very illiterate class—many of whom probably reached this country so shortly before the census was taken that their illiteracy could not be affected by the school opportunities offered here.[1] In making comparisons of this sort two considerations should not be overlooked. A public school system with universal compulsory attendance is expensive, entailing a heavy burden on a community with a relatively small per capita wealth. This is one of the reasons, probably, why illiteracy is so much more prevalent in the South Atlantic states, where the per capita wealth, according to the census of 1890, was $579, than in the North Atlantic states, with a per capita wealth of $1,232 in the same year.[2] Moreover, in addition to its handicap in financial resources, the South has a greater burden resulting from the fact that in proportion to the population the number of children is much greater there than in the North, and that separate schools are maintained for whites and negroes. The difference in the relative number of children is shown in Table XIV.

[1] The comparative illiteracy of native white and non-Caucasian children and of native and foreign born white children is discussed at length on pages 351–355.

[2] The statistics for 1900 corresponding to these for 1890 have not yet been published.

TABLE XIV.—*Number and per cent of population of school age (5 to 20 years), for main and minor geographic divisions: 1900.*

DIVISION.	POPULATION: 1900.		
		5 to 20 years of age.	
	Total.	Number.	Per cent.
Continental United States	75,994,575	26,041,940	34.3
North Atlantic division	21,046,695	6,308,377	30.0
New England	5,592,017	1,567,519	28.0
Southern North Atlantic	15,454,678	4,740,858	30.7
South Atlantic division	10,443,480	3,999,118	38.3
Northern South Atlantic	4,464,481	1,601,194	35.9
Southern South Atlantic	5,978,999	2,397,924	40.1
North Central division	26,333,004	8,953,121	34.0
Eastern North Central	15,985,581	5,293,105	33.1
Western North Central	10,347,423	3,660,016	35.4
South Central division	14,080,047	5,534,753	39.3
Eastern South Central	7,547,757	2,944,696	39.0
Western South Central	6,532,290	2,590,057	39.7
Western division	4,091,349	1,246,571	30.5
Rocky Mountain	1,232,642	378,578	30.7
Basin and Plateau	442,015	156,780	35.5
Pacific	2,416,692	711,213	29.4

The proportions given in this table show that in the North Atlantic states but 30.0 per cent of the population was between 5 and 20 years of age, while in the South Central states the per cent was 39.3. In both of the Southern main divisions the per cents are higher than in the Northern main divisions. When the population of school age is classified by age periods, similar differences between the various sections of the country exist at each age period.

Rank of states in child illiteracy.—In Table XV the states and territories are ranked according to their proportion of child illiteracy in 1900 and 1890.

Nearly every state shows a reduction in the proportion of illiteracy. The maximum proportion was 427.4 per 1,000 in 1890 and 328.8 per 1,000 in 1900. In 1890 there were only 2 states in which less than 10 per 1,000 children were illiterate; in 1900 there were 17 such states. But, of course, the improvement was more marked in some states than in others, and this naturally produced changes in the ranking, as is shown in the following table. For the majority of the states the change was not very great. For only 19 states did it make a difference of more than 2 in rank. The greatest gains were made by some of the Western states. Utah, which was the twenty-fourth state in 1890, became the eighth in 1900, an advance of 16. Wyoming showed a gain of 9; Oregon, of 8; Washington, of 6; and Idaho, of 4. Outside the Western divisions the only states showing an advance of 4 or more were Indiana (7), Nebraska (5), and the District of Columbia (4).

TABLE XV.—*Rank of states and territories according to proportion illiterate among children 10 to 14 years of age: 1900 and 1890.*

STATE OR TERRITORY.	ILLITERATES PER 1,000 CHILDREN 10 TO 14 YEARS OF AGE.		RANK ACCORDING TO ILLITERATES PER 1,000 CHILDREN 10 TO 14 YEARS OF AGE.		Increase (+) or decrease (−) in rank from 1890 to 1900.
	1900	1890	1900	1890	
Nebraska	3.4	12.5	1	6	+ 5
Iowa	3.7	7.7	2	1	− 1
Oregon	4.2	18.0	3	11	+ 8
Ohio	4.9	10.8	4	3	− 1
Kansas	5.2	11.4	5	4	− 1
Indiana	5.5	20.0	6	13	+ 7
Connecticut	5.7	12.1	7	5	− 2
Utah	6.6	37.6	8	24	+16
Massachusetts	6.7	8.3	9	2	− 7
Michigan	7.0	18.3	10	12	+ 2
Washington	7.0	22.5	11	17	+ 6
Minnesota	7.1	17.9	12	10	− 2
Wisconsin	7.3	16.5	13	9	− 4
New York	7.4	13.8	14	8	− 6
Illinois	8.2	12.5	15	7	− 8
Wyoming	9.2	37.7	16	25	+ 9
Vermont	9.5	24.3	17	18	+ 1
South Dakota	10.0	24.5	18	20	+ 2
California	10.1	20.8	19	14	− 5
Pennsylvania	10.1	21.8	20	16	− 4
New Jersey	11.9	21.4	21	15	− 6
Idaho	12.3	38.2	22	26	+ 4
Colorado	15.2	27.9	23	21	− 2
New Hampshire	16.9	33.7	24	22	− 2
District of Columbia	17.5	33.9	25	29	+ 4
Rhode Island	18.8	39.7	26	27	+ 1
Montana	19.3	35.3	27	23	− 4
Maine	20.8	24.3	28	19	− 9
North Dakota	23.5	44.2	29	28	− 1
Oklahoma	27.1	81.9	30	32	+ 2
Missouri	33.6	55.2	31	30	− 1
Delaware	45.1	90.4	32	33	+ 1
Maryland	46.4	94.6	33	34	+ 1
West Virginia	52.6	108.4	34	35	+ 1
Nevada	81.2	71.7	35	31	− 4
Kentucky	84.4	148.3	36	37	+ 1
Texas	92.6	144.5	37	36	− 1
Florida	137.6	175.7	38	38	0
Tennessee	149.2	190.6	39	39	0
Virginia	156.7	226.8	40	42	+ 2
Arkansas	162.0	221.0	41	41	0
New Mexico	199.3	279.6	42	44	+ 2
North Carolina	217.5	306.2	43	45	+ 2
Arizona	222.1	203.8	44	40	− 4
Mississippi	223.8	265.3	45	43	− 2
Georgia	227.9	332.7	46	46	0
Indian Territory	243.9	(1)	47	.....	.....
Alabama	288.9	355.0	48	47	− 1
South Carolina	295.6	389.7	49	48	− 1
Louisiana	328.8	427.4	50	49	1

[1] Figures not available.

On the other hand, the states exhibiting the most marked decline in rank are in the North Atlantic and North Central divisions. Maine, the nineteenth state in 1890, became the twenty-eighth in 1900; Illinois dropped from seventh to fifteenth; Massachusetts, from second to ninth; New York, from eighth to fourteenth; New Jersey, from fifteenth to twenty-first. There are also 4 of the states in the Western division which showed a considerable though smaller loss in rank, viz, California, Montana, Nevada, and Arizona. For convenience of comparison the proportions of illiteracy in 1890 and 1900 for the states showing the greatest changes of rank are given in the following statement:

STATE OR TERRITORY.	ILLITERATES PER 1,000 CHILDREN 10 TO 14 YEARS OF AGE.		RANK ACCORDING TO ILLITERATES PER 1,000 CHILDREN 10 TO 14 YEARS OF AGE.		Increase (+) or decrease (−) in rank from 1890 to 1900.
	1900	1890	1900	1890	
Utah	6.6	37.6	8	24	+16
Wyoming	9.2	37.7	16	25	+ 9
Oregon	4.2	18.0	3	11	+ 8
Indiana	5.5	20.0	6	13	+ 7
Washington	7.0	22.5	11	17	+ 6
Nebraska	3.4	12.5	1	6	+ 5
Idaho	12.3	38.2	22	26	+ 4
District of Columbia	17.5	53.9	25	29	+ 4
Wisconsin	7.3	16.5	13	9	4
Pennsylvania	10.1	21.8	20	16	4
Montana	19.3	35.3	27	23	4
Arizona	222.1	203.8	44	40	- 4
Nevada	81.2	71.7	35	31	4
California	10.1	20.8	19	14	- 5
New Jersey	11.9	21.4	21	15	6
New York	7.4	13.8	14	8	6
Massachusetts	6.7	18.3	9	2	- 7
Illinois	8.2	12.5	15	7	- 8
Maine	20.8	24.3	28	19	- 9

In many states the large proportion of negroes, Indians, or Mongolians is a barrier to progress in the reduction of illiteracy. The presence of a large proportion of foreign born whites may have a similar effect, although that depends largely upon the particular nationalities of which the foreign element is chiefly composed.

To eliminate the influence of the illiteracy of these classes of the population Table XVI has been prepared, in which the states are ranked with reference to the proportion of illiteracy among the native white children.

The elimination of negro, Indian and Mongolian, and foreign born white children reduces the proportion of child illiteracy in every state and territory. This reduction, being greater in some states than in others, produces many changes in rank. There is an advance in the rank (for 1900) of four North Atlantic states, viz, Massachusetts, Rhode Island, Connecticut, and New York; of the two Dakotas; of seven states in the Western division, viz, California, Washington, Montana, Utah, Wyoming, Nevada, and Arizona; and of eight Southern states, viz, District of Columbia, Maryland, Texas, Mississippi, Georgia, Alabama, South Carolina, and Louisiana. From this statement it may be inferred that the Eastern states mentioned are handicapped by the presence of the foreign born white children, the Western by the Indian and Mongolian, and the Southern by the negro.

On the other hand, there are several states with a large foreign born white element which decline in rank very materially when that element is eliminated from the comparison. These states, for the most part, are located in the middle West.

TABLE XVI.—*Rank of states and territories according to proportion illiterate among native white children 10 to 14 years of age: 1900 and 1890.*

STATE OR TERRITORY.	ILLITERATES PER 1,000 NATIVE WHITE CHILDREN 10 TO 14 YEARS OF AGE.		RANK ACCORDING TO ILLITERATES PER 1,000 NATIVE WHITE CHILDREN 10 TO 14 YEARS OF AGE.		Increase (+) or decrease (−) in rank from 1890 to 1900.
	1900	1890	1900	1890	
Washington	1.8	15.1	1	19	+18
Connecticut	1.8	5.2	2	3	+ 1
District of Columbia	2.1	11.5	3	13	+10
Utah	2.2	30.1	4	28	+24
Massachusetts	2.3	3.5	5	1	4
Oregon	2.4	14.0	6	17	+11
Nebraska	2.6	7.9	7	5	− 2
New York	2.6	8.5	8	7	− 1
Nevada	2.8	3.8	9	2	− 7
Iowa	3.2	6.3	10	4	- 6
Wyoming	3.7	32.9	11	31	+20
Montana	3.8	26.1	12	25	+13
Kansas	4.0	8.4	13	6	− 7
Minnesota	4.1	11.3	14	12	- 2
South Dakota	4.1	14.1	15	18	+ 3
Ohio	4.4	9.3	16	8	− 8
California	4.4	10.2	17	10	- 7
Indiana	5.1	18.4	18	23	+ 5
Michigan	5.6	12.8	19	15	− 4
Wisconsin	5.7	12.4	20	14	- 6
Pennsylvania	5.8	16.3	21	22	+ 1
Idaho	5.9	32.9	22	32	+10
Rhode Island	6.2	15.9	23	21	- 2
New Jersey	6.5	13.5	24	16	− 8
Illinois	6.6	9.9	25	9	−16
New Hampshire	6.7	10.9	26	11	−15
Vermont	7.4	19.0	27	24	− 3
North Dakota	7.6	28.2	28	27	- 1
Colorado	12.7	26.2	29	26	- 3
Maine	13.6	15.9	30	20	−10
Maryland	16.9	32.8	31	30	1
Delaware	17.8	32.4	32	29	− 3
Oklahoma	22.4	75.3	33	34	+ 1
Missouri	29.8	46.4	34	33	− 1
West Virginia	49.6	102.7	35	36	+ 1
Texas	61.0	100.5	36	35	− 1
Arizona	66.6	111.8	37	38	+ 1
Florida	69.1	106.2	38	37	− 1
Kentucky	74.7	116.7	39	39	0
Mississippi	77.5	116.7	40	40	0
Virginia	90.8	128.6	41	41	0
Georgia	104.3	167.3	42	43	+ 1
Arkansas	110.8	167.8	43	44	+ 1
Tennessee	116.4	139.9	44	42	− 2
South Carolina	148.4	212.8	45	46	+ 1
Alabama	153.4	208.2	46	45	− 1
Louisiana	160.7	237.9	47	48	+ 1
North Carolina	166.1	217.5	48	47	- 1
New Mexico	175.4	244.9	49	49	0
Indian Territory	224.9	(1)	50	.....	.....

[1] Figures not available.

The above figures show that, when the illiteracy of native white children only is considered, the variations in the rank of the states are on the whole more striking than when the comparison is based upon illiteracy statistics pertaining to all children without distinction of class. But whether the comparison be based on the illiteracy among all classes of children or on that among native white children only, it will be found that the states making the greatest gains in rank between 1890 and 1900 are some of the newer states of the far West, while those undergoing the greatest loss in rank are Northern states east of the Mississippi. The following statement shows the most conspicuous gains and losses in the rank as determined by the proportion of illiteracy among native white children:

STATE OR TERRITORY.	ILLITERATES PER 1,000 NATIVE WHITE CHILDREN 10 TO 14 YEARS OF AGE.		RANK ACCORDING TO ILLITERATES PER 1,000 NATIVE WHITE CHILDREN 10 TO 14 YEARS OF AGE.		Increase (+) or decrease (−) in rank from 1890 to 1900.
	1900	1890	1900	1890	
Utah	2.2	30.1	4	28	+24
Wyoming	3.7	32.9	11	31	+20
Washington	1.8	15.1	1	19	+18
Montana	3.8	26.1	12	25	+13
Oregon	2.4	14.0	6	17	+11
District of Columbia	2.1	11.5	3	13	+10
Idaho	5.9	32.9	22	32	+10
Indiana	5.1	18.4	18	23	+ 5
Wisconsin	5.7	12.4	20	14	− 6
Iowa	3.2	6.3	10	4	− 6
California	4.4	10.2	17	10	− 7
Nevada	2.8	3.8	9	2	− 7
Kansas	4.0	8.4	13	6	− 7

CHILD ILLITERACY IN CITY AND COUNTRY.

Distinction between city and country.—It is a well-known fact that illiteracy is much less in cities than in the country. This is proved by statistics. The proportion of illiterate children 10 to 14 years of age in 1900 was 10.4 per 1,000 in cities having at least 25,000 inhabitants as compared with 88.7 per 1,000 outside such cities. For several reasons, however, these proportions do not adequately represent the actual difference between city and country as regards the educational conditions and influences.

Statistics of illiteracy in cities refer to cities having a population of 25,000 and over. Accordingly, the term "country," as used in the discussion of illiteracy statistics, includes many smaller cities and suburban communities that have much more in common with the larger cities than with country districts proper. This fact becomes important when comparisons are made between different sections of the United States, since the number of these smaller cities and large towns varies greatly in different sections, as is indicated in Table XVII. In this table the term "country districts" is restricted to places having less than 2,500 inhabitants, this being the accepted Census distinction whenever the published statistics make it possible to separate the population living in places of that size.

In the New England states about three-tenths of the population which is classed as country population in the analysis of illiteracy statistics live in cities of from 8,000 to 25,000 inhabitants, while in the Eastern South Central states the corresponding proportion is not much over two one-hundredths. The bearing of this difference upon illiteracy statistics is plain when it is considered that many of these smaller cities are the wealthy suburbs of the larger cities, and that they often have better school systems than the larger cities enjoy.

The well-recognized cityward migration of the population tends also to cover up the real difference between city and country, by increasing illiteracy in cities without materially affecting illiteracy in the country. Illiteracy brought into cities by migration from the country is, of course, not chargeable to the school system of the cities to which such migrants go. In so far as the young children are concerned, their illiteracy will be reduced in a normal manner after a few years in their new homes, and will not affect the figures of subsequent censuses; but the census figures will be affected by the illiteracy of children who came into the cities so short a time before the census year that they had not received the benefit of the better school system there.

TABLE XVII.—*Per cent distribution by class of place of residence of population living in cities having less than 25,000 inhabitants or in country districts, for main and minor geographic divisions: 1900.*

DIVISION.	PER CENT OF POPULATION OF CITIES HAVING LESS THAN 25,000 INHABITANTS, OR COUNTRY DISTRICTS, LIVING IN—				
	Cities having—				Country districts.
	2,500 to 25,000 inhabitants.	8,000 to 25,000 inhabitants.	4,000 to 8,000 inhabitants.	2,500 to 4,000 inhabitants.

Pacific	20.6	7.8	7.1	5.7	79.4

Causes for greater illiteracy in country districts.—The greater illiteracy in the country does not necessarily indicate that the regard for education is less there than in the city. One cause of the difference is the difficulty of providing school facilities for a scattered country population. The development of the school transportation system, already inaugurated in many country communities, will tend to remove this disadvantage. Another circumstance also operating to the disadvantage of the country population is their smaller per capita wealth, which necessitates a smaller per capita local appropriation for school purposes. Realizing

that a certain amount of public instruction is indispensable for the general good of the state, legislatures in many states have imposed a state school tax. This system, by which the wealthier school districts are made to assist the poorer, will naturally tend to lessen the difference between city and country in the matter of illiteracy.

Geographic divisions, 1900.—Table XVIII makes possible a comparison between child illiteracy in city and country for each geographic division.

TABLE XVIII.—*Number and proportion illiterate among children 10 to 14 years of age living in cities having at least 25,000 inhabitants and in smaller cities or country districts, for main and minor geographic divisions: 1900.*

DIVISION.	CHILDREN 10 TO 14 YEARS OF AGE: 1900.

Rocky Mountain	15,606	57	3.7	99,336	5,694	57.3
Basin and Plateau	5,583	10	1.8	42,846	3,077	71.8
Pacific	59,196	314	5.3	157,324	1,480	9.4

In every geographic division the proportion of child illiteracy is lower in the larger cities than in the smaller cities or country districts. The difference is least in the North Atlantic division, where, as already noted, an exceptionally large proportion of the population outside the larger cities are living in smaller cities or towns, or in the suburbs of the larger cities, and accordingly have the advantage of school systems which are usually not inferior to those found in the larger cities.

In the North Central division the illiteracy of the country children is about the same as it is in the North Atlantic division, but the illiteracy of city children being considerably lower, the contrast between city and country is more marked.

In the Southern divisions the contrast is still greater. In the Northern South Atlantic division the proportion of country illiteracy is almost six times the proportion of city illiteracy. This difference is doubtless in part a result of the fact that the two states, Delaware and Maryland, with the District of Columbia, contain more than four-fifths of the total city population of this division, but less than one-fourth of the country population.

The greatest relative difference between city and country appears in the Rocky Mountain and the Basin and Plateau divisions, and probably represents the contrast as regards educational opportunities between new cities like Denver and Butte, settled largely by people from the North Atlantic and North Central states, and the scattered frontier settlements or sparsely settled tracts of country, where adequate educational facilities are difficult to obtain and where a considerable number of Indians still live in tribal relations.

The slight difference between city and country in the North Atlantic section is interesting, and becomes more so when the detailed table for states and territories (page 367) is examined and it is noticed that in New Hampshire, Massachusetts, and New York the proportion of illiteracy among children was actually greater in cities having at least 25,000 inhabitants than in smaller cities or country districts. This is probably a result of the presence of so many foreign born in the cities of these states; yet even this conclusion can not be stated positively, because of the two considerations mentioned above, i. e., the really urban character of so many of the places included with the rural districts in these states and the probably greater cityward migration there.

Geographic divisions, 1900 and 1890.—Table XIX is introduced to show the decrease in child illiteracy in the city and in the country during the decade from 1890 to 1900, for geographic divisions. This table indicates that the reduction of child illiteracy is going on in both city and country in all parts of the United States. The absolute decrease, as measured by the difference obtained by subtracting the proportion in 1900 from that in 1890, is usually greater in the country. On the other hand, the relative decrease, as represented by the ratio of the number per 1,000 in 1890 to the corresponding number in 1900, is usually greater in the cities. Thus for continental United States the proportion of illiteracy in the country was 122.8 per 1,000 in 1890 and 88.7 in 1900, a difference of 34.1, while in the city the decline was from 20.9 to 10.4, a difference of 10.5; but in the city the proportion was reduced by one-half, and in the country by less than three-tenths.

TABLE XIX.—NUMBER AND PROPORTION ILLITERATE AMONG CHILDREN 10 TO 14 YEARS OF AGE LIVING IN CITIES HAVING AT LEAST 25,000 INHABITANTS AND IN SMALLER CITIES OR COUNTRY DISTRICTS, FOR MAIN AND MINOR GEOGRAPHIC DIVISIONS: 1900 AND 1890.

DIVISION.	CHILDREN 10 TO 14 YEARS OF AGE.

Pacific	314	494	5.3	11.1	1,480	3,050	9.4	23.8

It would be difficult to decide whether the absolute reduction or the relative is the more significant as a measure of progress. When the proportion of illiteracy is small to begin with, a comparatively small actual reduction represents a comparatively large relative reduction. Probably a reduction of a fixed amount, say 10 per 1,000, in the proportion of illiteracy presents greater difficulties when the proportion is low than when it is high, and in that sense represents greater progress. But this fact would not justify the acceptance of the relative reduction as an exact measure of progress unless it can be assumed that the difficulties are in exact inverse ratio to the proportion of illiteracy; that is to say, are exactly five times as great when the proportion is 5 as they are when it is 25. This assumption seems hardly tenable.

The statistics indicate that in this country at the present period the actual reduction in the proportion of illiteracy generally becomes smaller as the goal—no illiteracy—is approached, and the relative reduction larger. Accordingly, a comparison of the relative reductions is almost invariably unfavorable to the more backward communities or classes, and conversely a comparison of the actual reductions is unfavorable to the forward communities or classes. It seems unsafe to rely solely and implicitly upon either standard of comparison.

A greater relative reduction of child illiteracy in city than in country appears in each of the main geographic divisions, except the North Atlantic. In this division, as already remarked, much of the population living in what is here termed "country" is virtually an urban population, consisting of the residents of smaller cities and towns or suburban districts. Moreover, the larger cities of this division are in some degree handicapped by the great influx of immigrants, bringing in, no doubt, a considerable number of illiterate children. This perhaps explains why the larger cities of New England show so small a reduction of illiteracy—smaller than that shown for the same class of cities in any other minor division. In 1890 there was only one minor division in which the proportion of illiteracy among city children was as low as it was in New England and one other in which it was lower. In 1900 there were six minor divisions—the Southern North Atlantic, the two North Central, and the three Western—in each of which the proportion was lower than in New England.

There are three minor divisions—the Southern North Atlantic, the Pacific, and the Western South Central—in which the relative reduction of child illiteracy was approximately the same in country as in city.

It may be objected that in this comparison of the relative progress of city and country, as shown by the reduction in the proportion of illiteracy, no account is taken of the fact that a number of cities which were under the 25,000 limit in 1890 passed that limit before 1900, and were thereby transferred from the country communities, as here defined, to the city. But the population of these cities formed such a very small proportion

either of the city population in 1900 or of the country population in 1890, that the effect of the transfer is insignificant.

Incidental reference has been made to the reduction of illiteracy among city children in New England as compared with other minor divisions. To carry this line of comparison somewhat farther, the following table has been prepared, showing the ranking of the several minor divisions with respect to child illiteracy in city and in country in 1900 and 1890:

TABLE XX.—*Rank of minor geographic divisions according to proportion illiterate among children 10 to 14 years of age living in cities having at least 25,000 inhabitants and in smaller cities or country districts: 1900 and 1890.*

DIVISION.	IN CITIES HAVING AT LEAST 25,000 INHABITANTS.					IN SMALLER CITIES OR COUNTRY DISTRICTS.				
	Illiterates per 1,000 children 10 to 14 years of age.		Rank according to illiterates per 1,000 children 10 to 14 years of age.		Increase (+) or decrease (−) in rank from 1890 to 1900.	Illiterates per 1,000 children 10 to 14 years of age.		Rank according to illiterates per 1,000 children 10 to 14 years of age.		Increase (+) or decrease (−) in rank from 1890 to 1900.
	1900	1890	1900	1890		1900	1890	1900	1890	
New England	8.0	10.2	7	3	4	11.7	20.1	4	2	−2
Southern North Atlantic	7.7	14.0	6	6	0	10.4	21.1	3	3	0
Northern South Atlantic	18.9	46.8	8	8	0	112.9	180.9	8	8	0
Southern South Atlantic	80.6	157.7	11	11	0	238.6	331.9	11	11	0
Eastern North Central	3.3	10.2	2	2	0	7.7	15.7	1	1	0
Western North Central	4.5	12.3	4	5	+1	16.0	28.2	5	5	0
Eastern South Central	44.3	75.0	9	10	+1	191.9	243.8	10	10	0
Western South Central	45.5	65.9	10	9	−1	169.3	243.6	9	9	0
Rocky Mountain	3.7	9.9	3	1	2	57.3	95.7	6	7	+1
Basin and Plateau	1.8	26.9	1	7	+6	71.8	75.5	7	6	1
Pacific	5.3	11.1	5	4	−1	9.4	23.8	2	4	+2

There were many changes in the rank of the several divisions as regards child illiteracy in the larger cities, the most striking being the decline in rank for New England and the advance for the Basin and Plateau division, registering the effect of a very marked reduction of child illiteracy in Salt Lake City. For the smaller cities and country districts the majority of the divisions show no change of rank, a fact indicative, perhaps, of the conservatism and comparatively slow progress of rural communities. Here, again, New England is one of the divisions which declined in rank, changing places with the Pacific division. There was a similar transposition in the rank of the Basin and Plateau and the Rocky Mountain divisions.

CHILD ILLITERACY, BY SEX.

It is generally admitted that opportunities for elementary education should be given equally to males and females, and such a condition is practically attained in most parts of the United States. Nevertheless, as already pointed out, the proportion of illiteracy is as a rule greater for boys than for girls; for in only four states—New York, South Dakota, Colorado, and New Mexico—and in 41 of the 160 cities is there an excess of illiteracy for girls. In only one state—California—and in 36 of the cities in continental United States there is the same proportion of illiteracy for male and female children 10 to 14 years of age. This condition—equality of illiteracy for males and females—may be regarded as the norm, and any considerable excess of illiteracy for either sex as a variation that calls for an explanation.

In the diagrams on pages 337 and 338 the age at which the norm is attained is shown for the different classes of the population, as well as for the aggregate, and in every case the children 10 to 14 years of age show a greater illiteracy for males than for females. A partial explanation is the fact that girls are not such violators of the compulsory education laws as boys. The great preponderance of boys in all truant schools bears witness to this. But many such truants never reach the truant schools, where they would be forced to learn to read and write. They elude all truant officers and spend their time on the streets, thus increasing the proportion illiterate among male children. Child labor is another factor which doubtless affects the comparative illiteracy of the two sexes. Boys more often than girls are required to contribute to the family income by becoming breadwinners. The census statistics of employment include only the population at least 10 years of age, and therefore do not cover the age period at which children ordinarily learn to read and write. But the following statement relating to the population 10 to 14 years of age affords some indication of the contrast between the two sexes as regards employment in gainful occupations during the period of childhood:

AGE PERIOD.	CHILDREN 10 TO 14 YEARS OF AGE: 1900.					
	Male.			Female.		
	Total.	Gainfully employed.		Total.	Gainfully employed.	
		Number.	Per cent.		Number.	Per cent.
10 to 14 years	4,089,318	875,342	21.4	4,002,633	321,982	8.0
10 years	883,519	105,380	11.9	859,864	36,525	4.2
11 years	799,238	119,628	15.0	785,812	39,150	5.0
12 years	829,325	163,649	19.7	810,680	57,664	7.1
13 years	782,593	196,830	25.2	769,944	71,597	9.3
14 years	794,643	289,855	36.5	776,303	117,046	15.1

Table XXI presents the number and proportion of illiterate children, classified by sex, for the geographic divisions in 1900.

TABLE XXI.—*Number and proportion illiterate among children 10 to 14 years of age, classified by sex, for main and minor geographic divisions: 1900.*

Pacific	109,379	928	8.5	107,141	866	8.1

The excess of illiteracy among boys is shown by this table to be common to every minor division except the Rocky Mountain. The excess as measured by the difference in the number of illiterates per 1,000 is greatest (50.5) in the Southern South Atlantic, but measured by the ratio of the higher number to the lower it is greatest in the Eastern North Central division.

Comparison with earlier censuses. The following table gives the proportion of illiteracy among male and female children, classified by race and nativity, for the last three censuses:

TABLE XXII.—*Proportion illiterate among male and female children 10 to 14 years of age, classified by race and nativity, for continental United States: 1900, 1890, and 1880.*

RACE AND NATIVITY.	ILLITERATES PER 1,000 MALE AND FEMALE CHILDREN 10 TO 14 YEARS OF AGE.					
	1900		1890		1880	
	Male.	Female.	Male.	Female.	Male.	Female.
Total	79.8	63.0	110.9	96.9	209.2	186.5
White	39.3	29.8	57.2	48.3	129.8	107.1
Native white—native parents	50.4	37.7	73.0	61.6	(1)	(1)
Native white—foreign parents	9.8	7.7	17.2	14.2	(1)	(1)
Foreign born white	58.5	53.0	62.3	56.4	(1)	(1)
Negro, Indian, and Mongolian	333.0	268.0	418.7	377.7	673.1	651.1
Negro	334.5	267.7	418.7	377.2	(1)	(1)
Indian and Mongolian	278.4	278.5	425.1	462.5	(1)	(1)

[1] Figures not available.

In every class of population given in the above table the proportion illiterate among the children of each sex was much less in 1900 than before, the decrease between 1880 and 1890 in the two classes for which the data were available being especially marked. The reduction in the proportion of illiteracy between 1880 and 1890 among the whites was greater for the boys than for the girls, while the reverse is true in regard to non-Caucasian (negro, Indian, and Mongolian) children. But between 1890 and 1900 the reduction in the proportion of illiteracy was greater for the girls than for the boys among the white as well as the non-Caucasian children. From 1890 to 1900 the greatest relative decrease in the illiteracy of each sex occurred among the native whites of foreign parentage, and the least among foreign born whites. In each class of population, except the Indian and Mongolian, the proportion of illiterate children was less for females than for males, and the relative decrease between 1890 and 1900 was greater for the former than for the latter, except among the foreign born whites. During the decade 1890 to 1900 the native white male children of native parentage became less illiterate than the foreign born white, and the Indian and Mongolian than the negro.

City and country, 1900.—The following table shows for city and country the illiterate children, classified according to sex, for main and minor geographic divisions:

TABLE XXIII.—*Number and proportion illiterate among children 10 to 14 years of age, classified by sex, living in cities having at least 25,000 inhabitants and in smaller cities or country districts, for main and minor geographic divisions: 1900.*

DIVISION.	CHILDREN 10 TO 14 YEARS OF AGE: 1900.

Pacific	128	4.4	800	10.0	186	6.2	680	8.8

The preceding table allows the same comparison to be made for city and country separately. For the country the only minor division showing an excess of illiteracy for female children is the Rocky Mountain. For the cities the divisions in which a similar excess appears are the Southern North Atlantic and the Pacific.

That the excess in the cities of these two divisions represents the influence of conditions in New York city and San Francisco is indicated by the following statement, which shows that when these cities are eliminated from the totals the excess of illiteracy for female children disappears, giving place to an excess for male children; and this suggests that it is the excess of female illiterates among the newly arrived immigrant children which produces the excess noted for the city totals in these two divisions:

CHILDREN 10 TO 14 YEARS OF AGE LIVING IN CITIES HAVING AT LEAST 25,000 INHABITANTS: 1900.

RESIDENCE.	Male.		Female.	
	Number illiterate.	Per 1,000 illiterate.	Number illiterate.	Per 1,000 illiterate.

CHILD ILLITERACY AMONG THE NATIVE WHITE AND NON-CAUCASIAN POPULATION.

General comparison.—Few facts about illiteracy are more patent than the differences between native white and non-Caucasian[1] population in this regard; these differences are very great, nearly one-half of the non-Caucasians and less than one-twentieth of the native whites being illiterate in 1900. But these proportions are very much reduced if only children 10 to 14 are considered. A little less than one-third of the non-Caucasian children were illiterate in 1900, while among native white children the proportion was about one-thirtieth. Children 10 to 14 years of age in 1900 would normally have learned to read and write between 1892 and 1900. It appears, however, that only a little over two-thirds of the non-Caucasian children accomplished this, as compared with a little less than twenty-nine thirtieths of the native white children. This difference is important, in view of the fact that non-Caucasian children are supposed to have the same opportunities for education at the public expense as those that have been offered to native white children living in the same community; but doubtless the difference is in part accounted for by the fact that, broadly speaking, the two classes are living in different communities—that is to say, by far the greater proportion of native whites live in Northern and Western states, while the non-Caucasians, consisting principally of negroes, are concentrated mainly in Southern states, where the school facilities are in general poorer, the standard of education lower, and the level of illiteracy higher than in the North.

Geographic divisions.—The effects of the difference in territorial distribution are partially eliminated in a comparison by geographic divisions, such as is presented in Table XXIV.

In continental United States as a whole the proportion of child illiteracy is approximately nine times as great for non-Caucasians as it is for native whites. In none of the main or minor geographic divisions outside the Western division is the contrast equally marked. In the North Central division the illiteracy of non-Caucasian children is, however, about eight times as great as that of the native white; but in the North Atlantic it is not quite six times, and in each of the main Southern divisions—the South Atlantic and the South Central—not much more than three times as great. According to this test, then, the difference between the two races as regards child illiteracy is not as marked in the South as in the North, and it follows as a corollary that the difference in child illiteracy between North and South is greater for the native whites than for the non-Caucasians.

Some interest attaches to the fact that if the minor divisions outside the Western (where the negro children are so few that the figures may be disregarded) are ranked with reference to the proportion of child illiteracy for native whites and for negroes separately, the two rankings will be almost identical. In other words, as the proportion of illiteracy decreases for one race it usually decreases for the other also, though not perhaps to the same extent, indicating that the negro, like the white man, responds to the influence of improved conditions.

[1] The total non-Caucasian, rather than negro population, is compared with the native white population throughout this section, since no separate figures for the illiteracy of negroes in cities were published in 1890. Except in some of the Western states, there are so few Indian, Chinese, and Japanese children 10 to 14 years of age that statistics for non-Caucasian children of those ages are approximately if not actually identical with those for negro children.

Pacific	90	1.6	607	4.1	136	123.1	706	177.0

The proportions for continental United States, as shown in Table XXV, are determined largely by the differences in territorial distribution of the two races. The proportion of illiteracy for native white children living in cities of at least 25,000 inhabitants represents practically conditions in the Northern states (North Atlantic and North Central divisions), which contain more than four-fifths of the total native white population living in this class of cities; but the proportion of illiteracy for the corresponding class of negro, Indian, and Mongolian children is influenced largely by conditions in the South, the Northern states containing less than three-eighths of the total non-Caucasian population living in such cities. The proportion of child illiteracy for negroes, Indians, and Mongolians living in smaller cities or country districts is not influenced to any appreciable degree by conditions in the North; but the corresponding proportion for native whites, while determined largely by conditions in the North, is affected to some extent by conditions in the South.

More interest attaches to a comparison of the proportions shown for the several geographic divisions. In every division except New England the proportion of child illiteracy for each race is considerably lower in the city than in the country; and in both city and country the proportions are always lower for native whites than for non-Caucasians. It may be noted that in the South the native white children living in the country have about as high a proportion of illiteracy as the non-Caucasian or negro children living in the city. This is but a natural result of the great contrast in the

South between city and country as regards educational opportunities.

A comparison of the relative differences in the proportions for the two races affords little basis for any general conclusions. Leaving out of consideration the Western divisions it will be found that the greatest relative difference between native white and non-Caucasian children living in cities of at least 25,000 inhabitants appears in the Northern South Atlantic division, and the smallest in the Southern South Atlantic. The contrast between the two classes of children living in smaller cities or country districts is greatest in the Western North Central division, and least in New England. In one case the extremes are both found in Southern divisions; in the other, in Northern. So far as this analysis goes it does not indicate that the relative differences between the races are on the whole greater in the North than in the South, and does not suggest that in regard to educational facilities the non-Caucasian race is at any greater disadvantage as compared with the native white in one section than in the other. But to decide this question would, of course, require further investigation and other and more detailed statistics than those presented here.

Comparison, 1900 and 1890.—The following table shows that both native white and non-Caucasian children have reduced their illiteracy since 1890:

TABLE XXVI.—*Number and proportion illiterate among native white, and negro, Indian, and Mongolian children 10 to 14 years of age, for main and minor geographic divisions: 1900 and 1890.*

DIVISION.	CHILDREN 10 TO 14 YEARS OF AGE.

Western division	5,477	7,824	15.6	31.2	4,351	2,696	320.1	442.8
Rocky Mountain	4,204	4,786	39.8	76.6	1,250	890	280.0	504.2
Basin and Plateau	576	1,184	13.7	38.9	2,259	532	559.7	764.4
Pacific	697	1,854	3.4	11.7	842	1,274	165.3	351.2

The table shows a decline of illiteracy in continental United States for both native white and non-Caucasian children. The proportion illiterate for the native whites was lowered by about one-third, or, more exactly, seven-twentieths; that for non-Caucasians, by one-fourth, or five-twentieths. Thus the relative reduction was greater for the native whites than for the non-Caucasian children; but the absolute reduction, obtained by subtracting the proportion illiterate in 1900 from the proportion illiterate in 1890, was greater for non-Caucasian children than for the white, being 97.9 per 1,000 for the former and 18.8 per 1,000 for the latter.

There is a similar contrast between the two classes in most of the main and minor geographic divisions. In each of these divisions the comparatively high proportion of illiteracy prevailing among non-Caucasian children was reduced by a greater absolute amount than the comparatively low proportion prevailing among the native white children; but the latter class, as a rule, shows the greater relative reduction. The only minor division which forms an exception to this rule is New England, in which there was a reduction of about five-ninths in the proportion of illiteracy for non-Caucasian children and of about four-ninths in the proportion for native white children. In the Southern North Atlantic and Eastern North Central divisions the relative reduction was about the same for the two classes here compared, being approximately two-thirds in the former division and about one-half in the latter. Thus a comparison of the relative reduction in the proportions here considered indicates that in the region east of the Mississippi and north of the Ohio, progress in the elimination of child illiteracy has been as marked for non-Caucasian children as for native white children.

Table XXVII carries this analysis a step farther by introducing the usual distinction between larger cities and smaller cities or country districts for each main and minor geographic division. A comparison of the figures for the several divisions shows that in both city and country the absolute reduction in the proportion of illiterate children was always greater for non-Caucasians than for native whites, while the relative reduction was, with a few exceptions, less. In the smaller cities or country districts the exceptions referred to appear in New England, in which the relative reduction is considerably greater for non-Caucasians than for native whites, and in the Southern North Atlantic division, in which it is practically identical for both classes; while in the larger cities the divisions in which the exceptions occur are the two North Central, where the relative reduction is somewhat greater for non-Caucasians than for native whites, and the Eastern South Central, where it is about the same for the two classes. In the Rocky Mountain division, where the non-Caucasians are mostly Indians and Mongolians, the rate of reduction in the larger cities is slightly greater for the non-Caucasians than for the native whites, and in the smaller cities or country districts it is approximately the same for the two classes.

TABLE XXVII.—NUMBER AND PROPORTION ILLITERATE AMONG NATIVE WHITE, AND NEGRO, INDIAN, AND MONGOLIAN CHILDREN 10 TO 14 YEARS OF AGE LIVING IN CITIES HAVING AT LEAST 25,000 INHABITANTS AND IN SMALLER CITIES OR COUNTRY DISTRICTS, FOR MAIN AND MINOR GEOGRAPHIC DIVISIONS: 1900 AND 1890.

CHILD ILLITERACY AMONG THE NATIVE AND FOREIGN BORN WHITE POPULATION.

Geographic divisions, 1900.—In general, foreign born white children are much more illiterate than native white children. There are parts of the country, however, where this does not appear to be the case, as shown by comparison of the proportions in the following table:

TABLE XXVIII.—*Number and proportion illiterate among native and foreign born white children 10 to 14 years of age, for main and minor geographic divisions: 1900.*

Pacific	202,282	697	3.4	9,145	255	27.9

Of the main divisions the South Atlantic is the only one in which there is greater illiteracy among the native white children than among the foreign born. The minor divisions in which the same exceptional condition prevails are the Southern South Atlantic and Eastern South Central.

It should be remembered that the foreign born white are concentrated in the larger cities to a much greater

extent than the native white. This is probably the explanation of the exceptional condition just noted.

A further analysis of the figures for the Southern South Atlantic division shows that the proportion of illiteracy is practically the same for foreign born white children and native white children living in cities of at least 25,000 inhabitants, and is also the same for both classes of children living in the smaller cities or country districts.[1] The difference between the two classes, as shown by the figures for the entire division, is but a natural result of the fact that about one-fifth of the foreign born white children and only one-thirtieth of the native white live in the larger cities. Therefore the effect of the superior educational standards of the city is greater upon the foreign born white population of the division than upon the native white.

Similar reasons exist for the higher proportion of illiteracy shown by the native white children in the Eastern South Central division. Only about one-fifteenth of these children live in the larger cities, while the corresponding proportion for foreign born white children is about nine-twentieths. In the city the proportion of child illiteracy for native white and foreign born white is 11.3 per 1,000 and 83.2 per 1,000, respectively; in the country, 110.6 and 89.2, respectively. Since so large a proportion of the native white children in this division live in the country, the proportion illiterate for the entire division (103.7 per 1,000) approaches closely to the high proportion for the country. On the other hand, since the foreign born white children are almost equally divided between city and country and the proportion illiterate is about the same in each section, the proportion illiterate for the division (86.5 per 1,000) does not differ much from either of the component factors. This close correspondence between the proportion illiterate for city and for country among foreign born white children suggests, that most of the foreign born whites in the country were living in the smaller cities which form part of the country as here defined, and not in distinctly rural communities. It is found, in fact, that in this division more than five-eighths of the foreign born white population and only one-eighth of the native white live in places having over 2,500 inhabitants. Thus the excess in illiteracy among native white children, as compared with foreign born white children, is a natural result of the fact that the great mass of native white children live in rural communities with comparatively poor educational advantages, while the major portion of the foreign born white children live in cities where the facilities for a primary education are good.

This contrast between native and foreign born white, as regards concentration in cities, exists to a greater or less extent in all geographic divisions, so that the actual difference in illiteracy between the two classes living in the same community is doubtless greater than a comparison of the proportions shown in Table XXVIII would indicate.

In the following table the distinction between city and country is introduced for each geographic division:

TABLE XXIX.—*Number and proportion illiterate among native and foreign born white children 10 to 14 years of age living in cities having at least 25,000 inhabitants and in smaller cities or country districts, for main and minor geographic divisions: 1900.*

CHILD ILLITERACY AMONG THE NATIVE WHITE POPULATION OF NATIVE AND OF FOREIGN PARENTAGE.

Geographic divisions, 1900.—The questions asked in 1890 and 1900 regarding the parentage of each person enumerated make it possible to compare the illiteracy of native children whose parents were also natives with those native children whose parents were foreign born. A comparison of the illiteracy statistics for native white children, classified by nativity of parents, as presented in Table XXX, reveals a somewhat surprising condition—a greater illiteracy in continental United States among the children of native whites than among the children of foreign born whites: 44.1 per 1,000 for the former and 8.8 per 1,000 for the latter class. This fact

[1] See Table XXIX.

might be taken to indicate that immigrants are more anxious than natives to secure for their children the advantages of an elementary education; but, of course, before any such conclusion is adopted the figures should be subjected to a more careful analysis.

TABLE XXX.—*Number and proportion illiterate among native white children 10 to 14 years of age of native and of foreign parentage, for main and minor geographic divisions: 1900.*

Pacific	118,982	349	2.9	83,300	348	4.2

The excess of illiteracy for native white children of native parents as compared with native white children of foreign born parents, exhibited in continental United States as a whole, appears also in all of the main geographic divisions except the North Atlantic. It is, however, confined to six of the minor divisions, comprising the two South Atlantic, the two North Central, the Eastern South Central, and the Rocky Mountain.

A comparison of the figures for states[1] shows that the excess of illiteracy among the children of native parents appears in all the Southern states except Texas, in only 3 North Atlantic states (Connecticut, New York, and New Jersey), in 5 North Central states (Ohio, Illinois, Iowa, Missouri, and Kansas), and in 4 Western states (Colorado, New Mexico, Nevada, and Oregon). It thus develops that the greater illiteracy among children of native parents is confined principally to the Southern states, appearing in only 12 of the 32 Northern and Western states.

City and country.—In the preceding discussion of the comparative illiteracy of native and foreign born children attention was called to the influence on the statistics of the concentration of the foreign born population in cities, where illiteracy is in general relatively small. The same influence affects a comparison between children of native white parents and children of foreign born white parents, the latter being concentrated in cities to a much greater extent than the former. This makes it desirable to carry the analysis a step farther, by introducing the usual distinction between the city and the country population. The result for main and minor divisions is shown in Table XXXI.

TABLE XXXI.—*Number and proportion illiterate among native white children 10 to 14 years of age, classified by nativity of parents, living in cities having at least 25,000 inhabitants and in smaller cities or country districts, for main and minor geographic divisions: 1900.*

[1] Figures given in Twelfth Census, Vol. II, Tables LXVII and LXVIII, placed upon a per 1,000 basis.

When comparison is made between the two classes of children the difference in illiteracy is in favor of the children of foreign parents in both city and country; but it is not so marked in the former as in the latter. Making the same comparison by geographic divisions, it will be found that in the Western North Central division, and in all the Southern minor divisions, except the Western South Central, a lower proportion of illiteracy for children of foreign parents again appears in the city as well as in the country; in the Rocky Mountain and Eastern North Central divisions it appears in country though not in city; while in the other divisions, comprising the two North Atlantic, the Western South Central, the Basin and Plateau, and the Pacific, it appears in neither city nor country.

By referring to Table XLVI, page 372, the same comparison can be made by states and territories. Of the 38 states containing cities of over 25,000 inhabitants, there are only 15 in which the comparison between the two classes of children living in these cities shows an excess of illiteracy among children of native parents. Of these 15 states, 9, including District of Columbia, are Southern states. When, however, the comparison is made for the population living outside this class of cities, it will be found that there are 27 states and territories, including 11 Northern and Western states and all of the Southern states and territories, except Texas, in which the illiteracy is greater among children of native parents. It thus appears that a greater illiteracy among children of native parents is more common in the South than in the North and West, and more common outside of the larger cities than within such cities. In fact, as regards the city population, a greater illiteracy among white children of native parents is the exception rather than the rule, but in the population outside the larger cities it exists in over one-half of the total number of states. Attention has been called to the fact that not all of this outside population lives in distinctly rural communities, a considerable portion of it living in smaller cities or suburban districts; and it would be expected that the proportion of the foreign born whites living in such cities would exceed the proportion of native whites. The actual difference is shown by the following table, which gives the per cent distribution by class of place of residence of the native white and the foreign born white populations living in cities having less than 25,000 inhabitants or in country districts:

TABLE XXXII.—*Per cent distribution by class of place of residence of native whites and foreign born whites living in cities having less than 25,000 inhabitants or in country districts, for minor geographic divisions: 1900.*

DIVISION AND NATIVITY.	POPULATION LIVING IN CITIES HAVING LESS THAN 25,000 INHABITANTS OR IN COUNTRY DISTRICTS, 1900. Per cent living in cities having—			
	8,000 to 25,000 inhabitants.	4,000 to 8,000 inhabitants.	2,500 to 4,000 inhabitants.	Per cent living in country districts.
New England:				
Native white	27.8	18.1	10.1	44.0
Foreign born white	42.1	21.7	10.9	25.3
Southern North Atlantic:				
Native white	14.5	8.4	5.1	72.0
Foreign born white	24.2	10.6	6.1	59.1
Northern South Atlantic:				
Native white	6.0	2.7	2.2	89.1
Foreign born white	12.1	4.7	3.5	79.7
Southern South Atlantic:				
Native white	4.1	3.2	1.8	90.9
Foreign born white	42.1	5.4	4.1	48.4
Eastern North Central:				
Native white	12.1	7.1	4.1	76.7
Foreign born white	18.7	8.1	5.0	68.2
Western North Central:				
Native white	4.9	5.0	3.7	86.4
Foreign born white	4.7	4.7	3.5	87.1
Eastern South Central:				
Native white	1.9	2.2	2.1	93.8
Foreign born white	8.9	10.6	6.3	74.2
Western South Central:				
Native white	3.2	2.7	2.3	91.8
Foreign born white	10.7	4.7	2.3	82.3
Rocky Mountain:				
Native white	9.4	4.5	6.5	79.6
Foreign born white	12.8	4.6	6.5	76.1
Basin and Plateau:				
Native white	4.7	7.9	9.3	78.1
Foreign born white	4.5	9.0	9.3	77.2
Pacific:				
Native white	7.5	7.2	5.8	79.5
Foreign born white	9.3	7.3	5.7	77.7

Outside the larger cities the foreign born whites are concentrated in the smaller cities to a greater extent than the native whites in every minor division except the Western North Central. In most parts of the United States the public school system is doubtless more efficient in these smaller cities than in the distinctly rural communities. In so far as that is the case the difference in the distribution of the two classes of children shown in the above table would give the children of foreign born parents an advantage as regards school facilities, which would tend to bring their proportion of illiteracy below that of the children of native white parents. This advantage is what might be called, in mathematical terminology, a function of two variables. It depends partly upon the greater degree of concentration in small cities and partly on the superiority of school systems in the small cities over those in the country districts. In the South the difference between city

and country as regards school systems is probably greater than in the North, as has been indicated by the comparison already made (page 346); hence the effect of concentration in cities, in giving an educational advantage, would likewise be greater in the South than in the North.

It will perhaps be noted in this connection that the Western North Central division, the one minor division in which, as indicated by the preceding table, there is no greater concentration in small cities on the part of the foreign born living outside the larger cities, is one of the divisions in which the children of foreign parents show a lower proportion of illiteracy than the children of native parents, a fact which, of course, seems to militate against the theory that the lower proportion is produced by the greater concentration in cities. That this result is due mainly to the influence of conditions prevailing in Missouri is indicated by the following comparison, in which the figures are given for Missouri alone and for the rest of the division:

RESIDENCE.	NATIVE WHITE CHILDREN LIVING IN CITIES HAVING LESS THAN 25,000 INHABITANTS OR IN COUNTRY DISTRICTS: 1900.			
	Native parents.		Foreign parents.	
	Number illiterate.	Per 1,000 illiterate.	Number illiterate.	Per 1,000 illiterate.
Western North Central division..	10,377	17.4	1,777	5.2
Missouri	9,126	40.2	316	12.2
Other states	1,251	3.4	1,461	4.7

Excluding Missouri, the degree of illiteracy in the smaller cities or country districts in this division is greater for children of foreign parents than for those of native parents. This is what should be expected, for in the other states of the division the native whites are concentrated in the smaller cities to a greater extent than the foreign born, as is shown by the following tabular statement:

RESIDENCE AND NATIVITY.	POPULATION LIVING IN CITIES HAVING LESS THAN 25,000 INHABITANTS OR IN COUNTRY DISTRICTS: 1900.			
	Per cent living in cities having—			Per cent living in country districts.
	8,000 to 25,000 inhabitants.	4,000 to 8,000 inhabitants.	2,500 to 4,000 inhabitants.	
Western North Central division:				
Native white	4.9	5.0	3.7	86.4
Foreign born white	4.7	4.7	3.5	87.1
Missouri:				
Native white	3.6	5.2	1.8	89.4
Foreign born white	6.1	7.4	2.5	84.0
Other states:				
Native white	5.5	4.9	4.4	85.2
Foreign born white	4.6	4.5	3.6	87.3

The fact already noted that, in some geographic divisions and states, particularly in the South, the comparison of the two classes of children living in cities of over 25,000 inhabitants shows a greater illiteracy among children of native parents, can not of course be attributed to differences in the distribution between city and country. But it may in some degree be the effect of cityward migration from the more illiterate country districts. The influence of this factor would be marked only in those sections where the contrast in illiteracy between city and country is marked, as in the South. The effect, moreover, would be confined principally to the children of native parents, since there is probably not much cityward migration on the part of the foreign born, most of whom settle in cities on their arrival in this country.

This analysis, then, points to the conclusion that the difference in the illiteracy of the two classes appearing in the totals for the United States and for the several geographic divisions and states and territories is largely influenced by the difference in local distribution, which is such that the children of foreign parents as a class live under better school systems than the children of native parents. Accordingly the difference in the proportions illiterate can not be accepted as indicative of a difference in the characteristics of the children or of their parents. If it is desired to ascertain whether one class of children or parents shows any marked superiority over the other as regards interest in elementary education, the comparison should be made between the two classes living in the same community, so that they are under practically the same local influences, are subject to the same school administration, and enjoy the same educational opportunities. A comparison by individual cities fulfills this requirement in a fairly satisfactory manner. Out of the 160 cities having over 25,000 inhabitants there are 53 in which the proportion illiterate is higher for the children of native parents than for those of foreign parents, 99 in which the reverse is true, and 8 in which the proportion was the same for the children of each class.

It should be noted, however, that in many of these cities the number of illiterates is so small that one or two more illiterates or one or two less in either class would be sufficient to turn the scale. On the whole, the result of this comparison by cities indicates that in the same communities there is little difference between the two classes of children as regards illiteracy, but such differences as appear are generally in favor of the children of native parents. The data for cities are given in Table XLVIII.

TABLE XXXIII.—NUMBER AND PROPORTION ILLITERATE IN POPULATION AT LEAST 10 YEARS OF AGE LIVING IN CITIES HAVING AT LEAST 25,000 INHABITANTS AND IN SMALLER CITIES OR COUNTRY DISTRICTS: 1900 AND 1890.

STATE OR TERRITORY.	POPULATION AT LEAST 10 YEARS OF AGE.											
	In cities having at least 25,000 inhabitants.						In smaller cities or country districts.					
	Total.		Illiterate.				Total.		Illiterate.			
			Number.		Per 1,000.				Number.		Per 1,000.

FAMILIES.

SUMMARY OF RESULTS.

In census usage the word "family" means the group of people, whether related by blood or not, who share a common dwelling and table. Census families are divided into two classes—private or natural families and economic families, the latter including hotels, boarding houses, boarding schools, institutions, and groups of laborers, miners, sailors, soldiers, etc.

The per cent of population in economic families is greatest in the Pacific division; the Rocky Mountain, Basin and Plateau, New England, and Southern North Atlantic divisions follow in the order given; while the proportion is lowest in the far Southern states east of the Mississippi.

Among the states and territories the largest proportion of population living outside of private or natural families is found in the two outlying districts, Alaska and Hawaii, where from one-fourth to two-fifths of the population are so living. In continental United States the largest proportion is found in Wyoming and Montana.

In all parts of continental United States the per cent of population in economic families is greater in the cities having at least 25,000 inhabitants than in the smaller cities or country districts. In Hawaii, outside of Honolulu, on the contrary the proportion is much higher than it is in the city and approaches that in Alaska.

Including Honolulu, Hawaii, there are 17 cities in the United States having at least 25,000 inhabitants with at least one-tenth of their population in economic families. Only 1, Atlantic City, lies east of the Mississippi river, while 7 of the 8 Pacific coast cities of the size specified are included in the group.

In continental United States the size of families is decreasing. The average number of members in a family was 5.1 in 1870, 5.0 in 1880, 4.9 in 1890, and 4.7 in 1900. In the North Atlantic and North Central divisions this change has been going on throughout the thirty-year period, while in the other three main geographic divisions the average size of the family increased somewhat from 1870 to 1890, but declined rapidly in the following ten years. In 1900 the average size was smallest in Nevada, with only 3.8 members in a family, and next smallest in Arizona, 4.1; while in 1890 it was smallest in Oklahoma, 4.1, and next smallest in New Hampshire and New Mexico, 4.3.

In 1890 the most usual size for a family in continental United States was four members, the number of families of that size exceeding by 15,773 the number having three members. In 1900, however, there were 100,387 more families of three members than of any other size.

The prevailing size of the family was three in three-eighths of the states and territories in 1890, and in three-fifths of them in 1900. Three was also the prevailing size of the family in three-fifths of the cities having at least 25,000 inhabitants in 1890, and in seven-tenths of such cities in 1900.

DISCUSSION OF FAMILIES.

Definitions.—A family in the ordinary or popular sense of the word means a group of persons bound together by ties of kindred. Usually the members live together, but this is not necessarily involved, for a married son or daughter occupying a separate house is often included as a member of the family into which he or she was born. On the other hand, persons who live with a family, as servants, laborers, or boarders, are not usually deemed members. Such ties of kindred binding together the members of a family interlace in manifold and complex ways, and, in consequence, an individual often belongs to two or more families in the popular sense of the word. For census purposes, on the contrary, each person must be assigned to only one family as he must be assigned to only one place of residence, only one race, etc. For this reason the census finds this popular definition of a family inapplicable to its field of work. There is another practical or administrative difficulty. The test of kindred can not be applied by the enumerator. In many cases families of relatives are dispersed through the community, returns about them coming on different schedules and through different enumerators. Under such conditions it is impracticable for the names of the members and the facts about them to be assembled in the tabulation. Accordingly, in this field the census is forced to abandon the effort to bring together data that belong together, and to

confine itself to the simpler and more practicable task of tabulating together data that are found conjoined by the enumerators. The census test of a family can not be kinship by blood; it is association in home life. Persons living in the same home are for census purposes members of one family. Perhaps this idea is conveyed with less ambiguity by the word "household." In the following discussion, therefore, household and family will be used interchangeably as synonyms.

In census usage the word family means the group of people, whether related by blood or not, who share a common dwelling and table. If one person sleeps and eats alone, he constitutes for census purposes a family or household. On the other hand, if a large group of people sleep and eat in a common dwelling, like a hotel or convent, they make up a single census family. Census families, therefore, have been divided at the present census into two classes—private or natural families and economic families. In private or natural families the conditions warrant the assumption that ties of kindred, or economic motives originally rooted in such ties, are the main, although often not the sole, bond of union. The economic families are those in which the conditions warrant the assumption that ties of kindred are absent or play an entirely subordinate part in creating or maintaining the union of the group. These economic families include hotels, boarding houses, boarding schools, institutions, and "groups of laborers at work on farms and plantations, railroads, roads, etc.; groups of miners and lumbermen in camps, etc.; crews of boats and vessels; soldiers and sailors at military posts and stations and on naval vessels; and miscellaneous groups of persons lodging together but having no family relationship." [1]

Economic families.—The number of these economic families and the per cent that they make of the whole number of families, and the population they include of the whole population are indicated in the following table:

[1] Twelfth Census, Vol. II, page clviii.

TABLE I.—FAMILIES, CLASSIFIED AS PRIVATE AND ECONOMIC, WITH THE PER CENT ECONOMIC FAMILIES FORM OF ALL FAMILIES AND POPULATION IN ECONOMIC FAMILIES FORMS OF THE TOTAL POPULATION, FOR MAIN GEOGRAPHIC DIVISIONS: 1900.

DIVISION.	NUMBER OF			POPULATION IN—			PER CENT THAT—	
	Total families.	Private families.	Economic families.	Total families.	Private families.	Economic families.	Economic families form of total families.	Population in economic families forms of total population.
Continental United States	16,187,715	15,963,965	223,750	75,994,575	73,410,992	2,583,583	1.4	3.4
North Atlantic	4,623,740	4,557,266	66,474	21,046,695	20,180,490	866,205	1.4	4.1
South Atlantic	2,101,757	2,078,603	23,154	10,443,480	10,222,343	221,137	1.1	2.1
North Central	5,695,250	5,632,548	62,702	26,333,004	25,512,205	820,799	1.1	3.1
South Central	2,836,316	2,808,210	28,106	14,080,047	13,824,337	255,710	1.0	1.8
Western	930,652	887,338	43,314	4,091,349	3,671,617	419,732	4.7	10.3

Geographic divisions.—From the definition already given of economic families it might be inferred that probably the largest proportion of such families is among the city population. It is therefore not surprising to find from the following comparison a general correspondence between the per cent of population living in economic families and the per cent of population living in cities.

TABLE II.—*Per cent of population in cities and in economic families, for main geographic divisions: 1900.*

DIVISION.	Per cent of population in cities having at least 2,500 inhabitants.	Per cent of population in economic families.
Continental United States	40.2	3.4
North Atlantic	68.2	4.1
Western	40.6	10.3
North Central	38.5	3.1
South Atlantic	21.4	2.1
South Central	15.5	1.8

It is apparent that these two series correspond in some degree, but the figures show in the Western division a much larger per cent of population in economic families than in any other division. Special reasons must exist in that division for the widespread practice of living in households not bound together primarily by family ties.

The 11 minor geographic divisions of continental United States rank as follows in the per cent of population living in economic families.

TABLE III. *Per cent of population in economic families, for minor geographic divisions: 1900.*

DIVISION.	Per cent of population in economic families: 1900.
Continental United States	3.4
Pacific	11.5
Rocky Mountain	9.2
Basin and Plateau	6.4
New England	4.3
Southern North Atlantic	4.0
Western North Central	3.1
Eastern North Central	3.1
Northern South Atlantic	2.7
Western South Central	2.0
Southern South Atlantic	1.6
Eastern South Central	1.6

It will be noticed that the per cent of population living outside private families is greatest on the Pacific coast and greater in each of the three parts of the Western division than in any other of the minor geographic divisions. Next to these come the two parts of the North Atlantic division, then the two parts of the North Central, while the lowest proportion is found in the far Southern states east of the Mississippi.

States and territories.—The following table shows the proportions for the states and territories of the area of enumeration in order of decreasing per cent of population in economic families:

TABLE IV.—*Per cent of population in economic families, for states and territories: 1900.*

STATE OR TERRITORY.	Per cent of population in economic families: 1900.	STATE OR TERRITORY.	Per cent of population in economic families: 1900.
Alaska	37.7	Utah	3.4
Hawaii	28.4	Illinois	3.3
Wyoming	15.6	Vermont	3.2
Montana	15.3	Michigan	3.1
Washington	13.8	New Mexico	3.1
Nevada	11.6	Ohio	3.1
Arizona	11.2	Maryland	3.0
California	11.1	Missouri	3.0
Oregon	10.1	Delaware	2.7
Colorado	8.0	Oklahoma	2.5
Idaho	7.4	West Virginia	2.5
District of Columbia	6.3	Iowa	2.4
New York	4.8	Indiana	2.2
Massachusetts	4.7	Louisiana	2.2
Minnesota	4.7	Virginia	2.2
Rhode Island	4.4	Kansas	2.1
North Dakota	4.3	Texas	2.1
New Hampshire	4.2	Tennessee	1.9
Connecticut	4.0	Georgia	1.8
Wisconsin	3.8	Alabama	1.6
Florida	3.7	Arkansas	1.6
Maine	3.5	Kentucky	1.6
Nebraska	3.4	Indian Territory	1.4
New Jersey	3.4	Mississippi	1.4
Pennsylvania	3.4	South Carolina	1.3
South Dakota	3.4	North Carolina	1.2

This table indicates that the largest proportion of population living outside of natural families is found in the two outlying districts, Alaska and Hawaii, where from one-fourth to two-fifths of the population are so living. In continental United States the largest proportion is found not on the Pacific coast, but in Wyoming and Montana, of the Rocky Mountain division.

City and country.—To determine whether there is a relation between urban life and the proportion of people living in economic families, the per cents have been computed for the cities having at least 25,000 inhabitants and for the rest of continental United States. These figures show that in those cities, the total population of which is 19,718,312, the population living in economic families is 1,085,855, or 5.5 per cent. The population outside of these large cities, consisting of 56,276,263, includes 1,497,728 persons living in economic families, or 2.7 per cent. The following table shows the per cent living in economic families for each state and territory, the states being arranged in the order of decreasing per cent of total population in economic families. That in some instances the figures appear only in the second column is due to the fact that the state or territory in question contained in 1900 no city having at least 25,000 inhabitants.

TABLE V.—*Per cent of population in economic families in cities having at least 25,000 inhabitants and in smaller cities or country districts, for states and territories: 1900.*

STATE OR TERRITORY.	PER CENT OF POPULATION IN ECONOMIC FAMILIES: 1900.		EXCESS OF PER CENT.	
	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.
Alaska		37.7		
Hawaii	18.9	31.6		12.7
Wyoming		15.6		
Montana	20.3	14.6	5.7	
Washington	24.9	9.0	15.9	
Nevada		11.6		
Arizona		11.2		
California	13.3	9.9	3.4	
Oregon	24.8	6.0	18.8	
Colorado	9.4	7.4	2.0	
Idaho		7.4		
District of Columbia	6.3			
New York	5.2	4.0	1.2	
Massachusetts	5.2	4.1	1.1	
Minnesota	8.5	3.5	5.0	
Rhode Island	4.2	4.7		0.5
North Dakota		4.3		
New Hampshire	5.7	3.9	1.8	
Connecticut	5.0	3.5	1.5	
Wisconsin	4.5	3.6	0.9	
Florida	5.6	3.6	2.0	
Maine	6.2	3.3	2.9	
Nebraska	10.5	2.0	8.5	
New Jersey	3.4	3.4		
Pennsylvania	3.7	3.2	0.5	
South Dakota		3.4		
Utah	5.2	3.0	2.2	
Illinois	4.6	2.4	2.2	
Vermont		3.2		
Michigan	3.3	3.1	0.2	
New Mexico		3.1		
Ohio	5.0	2.3	2.7	
Maryland	3.8	2.3	1.5	
Missouri	6.9	1.5	5.4	
Delaware	3.2	2.2	1.0	
Oklahoma		2.5		
West Virginia	3.2	2.5	0.7	
Iowa	6.2	2.0	4.2	
Indiana	4.1	2.0	2.1	
Louisiana	4.4	1.6	2.8	
Virginia	5.7	1.9	3.8	
Kansas	2.7	2.1	0.6	
Texas	8.3	1.7	6.6	
Tennessee	6.5	1.2	5.3	
Georgia	5.2	1.4	3.8	
Alabama	6.2	1.3	4.9	
Arkansas	11.8	1.3	10.5	
Kentucky	4.2	1.2	3.0	
Indian Territory		1.4		
Mississippi		1.4		
South Carolina	4.0	1.2	2.8	
North Carolina		1.2		

The table shows that in all parts of continental United States the proportion of the population living in economic families is greater in the cities having at least 25,000 inhabitants than in the smaller cities or country districts. The very slight exception in the case of Rhode Island may be disregarded. In Hawaii, outside of Honolulu, owing probably to the employment of large gangs of immigrant laborers in the agricultural districts of the island, the proportion is much higher than it is in the city and approaches that in Alaska, being double that in any of the continental states or territories.

In the following table the 17 cities having at least 25,000 inhabitants in 1900 and with at least one-tenth of their population living outside of natural families, are given in order of decreasing per cent of population in economic families.

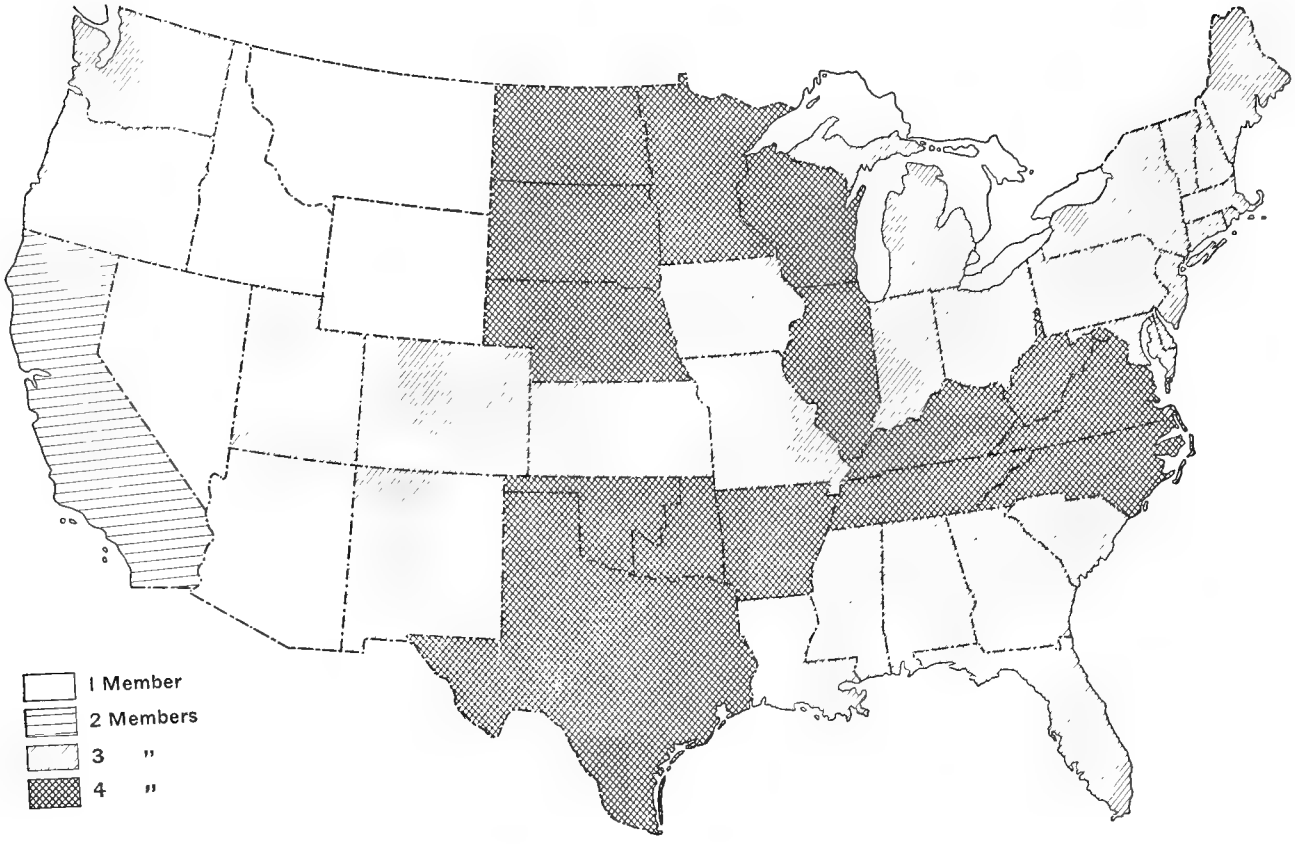
TABLE VI.—*Per cent of population in economic families, for cities having at least 25,000 inhabitants with at least 10 per cent of their population in economic families: 1900.*

CITY.	Per cent of population in economic families: 1900.
Seattle, Wash	32.1
Portland, Oreg	24.8
Butte, Mont	20.3
Atlantic City, N. J	20.0
Spokane, Wash	19.3
Honolulu, Hawaii	18.9
Superior, Wis	15.8
San Francisco, Cal	15.8
Tacoma, Wash	15.2
Duluth, Minn	13.8
South Omaha, Nebr	13.1
Lincoln, Nebr	12.8
Little Rock, Ark	11.8
St. Joseph, Mo	11.4
Sacramento, Cal	11.2
Pueblo, Colo	10.2
Los Angeles, Cal	10.0

It will be noticed that the only one of these cities which lies east of the Mississippi is Atlantic City, a summer resort crowded with hotels and boarding houses, and that 7 of the 8 cities of at least 25,000 inhabitants in the Pacific coast states are in this group. The only cities of the Far West in which the population lives in families to a degree at all comparable with that in eastern cities are Oakland, Cal., Salt Lake City, Utah, and Denver, Colorado.

Size of families.—Table X (page 382) shows that the average number of members in a family is decreasing, being 5.1 in 1870, 5.0 in 1880, 4.9 in 1890, and 4.7 in 1900. In the North Atlantic and North Central divisions this change has been going on throughout the thirty-year period. In the other three divisions, South Atlantic, South Central, and Western, the average size of the family increased somewhat from 1870 to 1890, but rapidly declined in the following ten years. Among the minor divisions the exceptions to the changes in the size of the family characteristic of the corresponding main division are the Northern South Atlantic division, in which there has been a decrease during the thirty-year period; the Eastern South Central division, in which there was an increase from 1870 to 1880, and a decrease from 1880 to 1900; and the Basin and Plateau division, in which there was a decrease from 1870 to 1880, an increase from 1880 to 1890, and a decrease from 1890 to 1900. The average size of a family at the present time is smallest in the Western division, 4.4, while in 1890 it was smallest in the North Atlantic division, 4.7. Among the minor divisions the average size of the family was smallest in 1900 in the Rocky Mountain division, 4.3, and in 1890 in New England, 4.5. Among the states and territories it was smallest in Nevada, with only 3.8 members in a family, and next smallest in Arizona, 4.1; while in 1890 it was smallest in Oklahoma, 4.1, and next smallest in New Hampshire and New Mexico, 4.3. This shifting in the average size of a family may be due to numerous and complex changes in the composition of families in the last ten years. To ascertain what these changes have been the total number of families has been distributed according to the number of members each contains. They run as follows:

TABLE VII.—*Number and per cent of families with specified number of members, for continental United States: 1900 and 1890.*



SIZE OF FAMILY.	NUMBER OF FAMILIES WITH SPECIFIED NUMBER OF MEMBERS.		PER CENT OF FAMILIES WITH SPECIFIED NUMBER OF MEMBERS.		CHANGE OF PER CENT: 1890 TO 1900.	
	1900	1890	1900	1890	Increase.	Decrease.

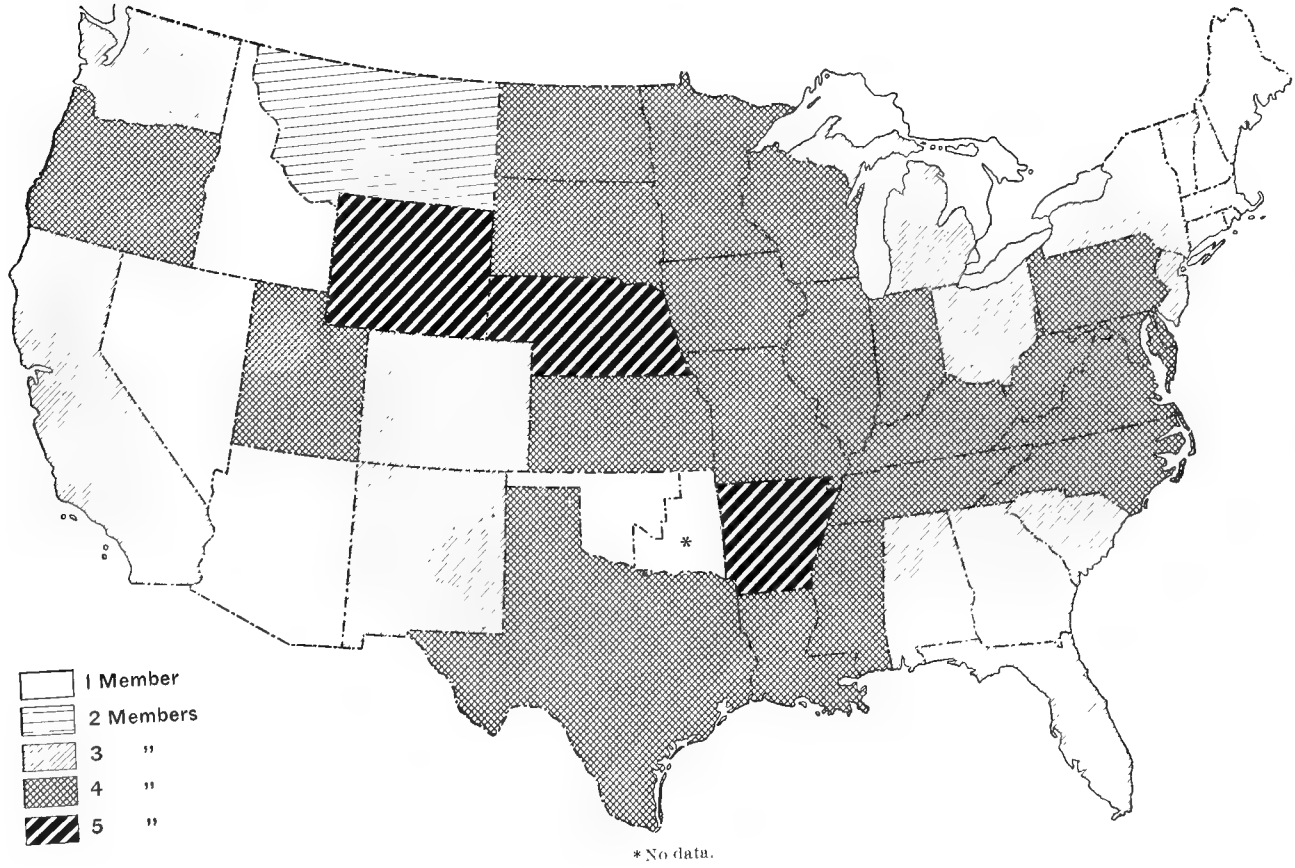
The figures show that in 1890 the most usual size for a family in continental United States was four members, while families of three members were slightly less numerous. In the ten years between 1890 and 1900 the families of four members have increased at a slightly greater rate than the total number, while the families of three members increased at a much greater rate. As a result, in 1900 there were in the country 100,387 more families of three members than of any other size, while in 1890 there were 15,773 more families of four members than of any other size.



Prevailing size.—Maps 40 and 41 indicate for 1890 and 1900 the prevailing size of family in each state or territory. They are not to be interpreted as meaning that families of the specified size were a majority of all families. In every case, indeed, there were more families of all other sizes. Prevailing size means that size which embraced more families than any other single size.

The figures on which the maps are based will be found in Eleventh Census, Population, Part I, Table 92, and Twelfth Census, Volume II, Table 99. From those tables the totals shown in Table VIII have been derived, Indian Territory, Alaska, and Hawaii, which were not reported in 1890, being omitted.

MAP 40.—PREVAILING SIZE OF FAMILY: 1900.

MAP 41.—PREVAILING SIZE OF FAMILY: 1890.

*No data.

TABLE VIII.—*Prevailing size of family in states and territories: 1900 and 1890.*

Total	49	49
1 member	5	4
2 members	1	1
3 members	29	18
4 members	14	23
5 members	0	3

In 1890 three-eighths and in 1900 three-fifths of the states and territories had three as the prevailing size of family. In 1890 there were 26 states in which the prevailing size was four or five; in 1900 only 14, or about half as many. Perhaps the most noteworthy change was in Wyoming. In 1890 there were 179 more families of five members than of any other size; in 1900 there were 527 more families of one member than of any other size. In 1890 there were three areas east of the Mississippi river—the northeastern states from Maine to New Jersey, the southeastern from South Carolina to Alabama, and the central states of Ohio and Michigan—in which the prevailing size of family was three; in 1900 the northeastern area had extended southward to the Potomac by including Pennsylvania, Delaware, Maryland, and the District of Columbia; the southeastern had extended westward by including Mississippi and Louisiana.

A similar change has been in progress in the cities. The tabulation was made at each census for the cities having at least 25,000 inhabitants—124 in 1890 and 160 in 1900. The following figures compiled from Eleventh Census, Population, Part I, Table 93, and Twelfth Census, Volume II, Table 100 show the results reached:

TABLE IX.—*Prevailing size of family in cities having at least 25,000 inhabitants: 1900 and 1890.*

PREVAILING SIZE OF FAMILY.	NUMBER OF CITIES WITH FAMILIES OF SIZE SPECIFIED MORE NUMEROUS THAN ANY OTHER SINGLE SIZE.

At each census the prevailing size of family in the large cities of continental United States was three. But the concentration on this size has increased. In 1890 in three-fifths and in 1900 in seven-tenths of the cities this was the prevailing size of family. In 1900 there were also 11 cities in which the prevailing size of family was two. Examination of the table in the Twelfth Census referred to above shows that 10 of these cities, all but Butte, Mont., were southern cities. In one-third of the large cities in the South, 10 of 29, two is the prevailing size of family. As these 10 cities—Charleston, Atlanta, Augusta, Savannah, Jacksonville, Birmingham, Montgomery, Mobile, New Orleans, and Nashville—lie in or near the black belt, and as it appears elsewhere[1] that the proportion of children, and therefore probably the size of families, among negroes living in cities is very small, it may be conjectured that if these families had been classified also by race, the small size would be found due in the main to the small size of negro families in those cities.

MARITAL CLASSES.

SUMMARY OF RESULTS.

In continental United States nearly three-fifths of the total population are single, rather more than two-fifths are or have been married, and the widowed and divorced amount to about one-seventh of the married.

The returns for divorced are of doubtful accuracy; therefore little use can be made of them. Because of the relatively small numbers of divorced this source of error does not vitiate the returns for single, married, and widowed.

Continental United States, in comparison with other countries, has in general a small proportion of single, a large proportion of married, an average proportion of widowed, and a large proportion of divorced. To this general rule India, with a smaller proportion of single, a larger proportion of married, and a larger proportion of widowed, forms the most notable exception.

The North has in the total population a smaller proportion single and a larger proportion married than the South.

The largest proportion of single in the total population is in the Southern South Atlantic division and the smallest in New England. Among the individual states the smallest proportion of single is in Vermont (50.1 per cent) and the largest in North Dakota (64.0 per cent).

The proportion of married is above the average in a belt of states running in a southwesterly direction from Maine to New Mexico and Colorado inclusive, and comprising for the greater part the most densely populated states.

The greatest proportion of widowed is in the District of Columbia (8.3 per cent) and the least in North Dakota (2.8 per cent).

The total number of males in continental United States being greater than the total number of females, the proportion of husbands to the males of all ages is necessarily less than the proportion of wives to the females of all ages, while the proportion of single and widowed is greater for males than for females. This distribution of the several classes varies throughout the country, but, as a rule, where females outnumber the males, as along the Atlantic coast, the proportion of spinsters is large and of bachelors small, and where the converse is true, as in all states west of the Mississippi river, the proportion of spinsters is small and of bachelors large. The greatest proportion of bachelors is in Wyoming (68.7 per cent) and the least in Vermont (52.9 per cent). The greatest proportion of spinsters is in North Carolina (60.7 per cent) and the least in Vermont (47.3 per cent).

There are 142,527 more husbands than wives reported in continental United States, this excess being due to the large number of immigrant husbands not accompanied by their wives.

The line of demarcation between city and country being placed at 25,000 inhabitants a larger proportion of widowed is found in the city than in the country. For the other classes the differences between city and country are small.

In the North the excess in the number of single in 1,000 of the total population in the city as compared with the country is greater than it is in continental United States.

By confining the figures to the adult population at least 15 years of age the child factor is eliminated and more significant results reached.

In the adult population of continental United States there is a large proportion of married and a small proportion of single and of widowed, as compared with other countries.

In the adult population of the North there is a larger proportion of single and a smaller proportion of married than in that of the South. This is contrary to the result for the total population.

In the extreme West and Northwest, with the exception of Idaho and Utah, two-fifths of the population are single. In scattered states, all having a predominantly rural population, less than a third of the adult population is single.

The largest proportion of married adults is in the agricultural states with a small city population.

The largest proportion of widowed adults is in the District of Columbia (11.0 per cent) and the smallest in Wyoming (4.4 per cent).

In Wyoming, Montana, Nevada, and Washington, states with a large excess of males, more than one-half of the adult males are single. It is generally true that the greater the excess of adults of either sex the greater

proportion of single in that sex. The proportion of single among adult males is least in Vermont (35.1 per cent).

The proportion of single among adult females is greatest in the District of Columbia (38.2 per cent) and least in New Mexico (19.8 per cent).

The largest proportion of husbands among adult males is found in Indiana (57.7 per cent) and of wives among adult females in Oklahoma (69.6 per cent); the smallest proportion of husbands in Wyoming (37.1 per cent) and of wives in the District of Columbia (45.2 per cent).

The proportion of widowers is greatest in the 3 northern New England states (6.3 per cent) and least in Utah (3.3 per cent); the proportion of widows is greatest in the District of Columbia (16.0 per cent) and least in North Dakota (6.3 per cent).

The proportions in the several classes of single, married, and widowed are largely influenced by the proportion of urban or rural population in a state.

There is proportionally a slight excess of adult females in the city and an excess of adult males in the country. The proportion of single does not vary much from city to city. The proportion of married is high in northern and low in southern and western cities, and on the contrary the proportion of widowed is low in northern and western cities and high in southern. Out of the 160 cities the proportion of single in the adult population is greater than one-half in only one, Seattle, Wash. (52.3 per cent). The smallest proportion of single is in Camden, N. J. (31.1 per cent). The proportion of married is greatest in Kansas City, Kans. (60.0 per cent) and least in Seattle, Wash. (42.2 per cent). Out of 29 southern cities 15 have less than one-half of the adult population married, as compared with 20 out of the 131 other cities. A comparison of the North and West with the South, distinguishing in each the urban and rural population, shows that in the cities of the North and West there are 34 more married persons in 1,000 adults than in the cities of the South. In the country the proportion was the same in both sections.

Marital condition depends largely on age. At birth and through childhood and early youth everyone is single. After that the proportion single decreases at each age period. Of those that reach old age 15 out of 16 are or have been married. After 65 years of age the married and the widowed are almost equally numerous. After 30 years of age single life is most common in the Western division, although before that age it is most common in the North Atlantic division. Between 15 and 65 years of age it is least common in the South Central division. Through the early adult age periods married life is most common in the South Central division, but after 35 years of age it is most common in the North Central division. During the earlier adult years and the last years of life it is least common in the North Atlantic division, but from 25 to 64 years of age it is least common in the Western division. At each age period up to 65 widowhood is most common in the South Central division. It is least common in the following divisions at the age period specified: North Atlantic, 15 to 34; North Central, 35 to 64; Western, 65 and over.

The greater proportion of young wives in the South indicates one reason for the larger proportion of children in that section, to which attention is elsewhere called.

Drawing the line of demarcation between city and country at 100,000 inhabitants makes it possible to consider the age grouping in the several classes for cities having at least 100,000 inhabitants and for smaller cities or country districts. The figures show that at each age period the proportion of single is greater and of married less in the city than in the country.

Women maturing sooner than men and not needing to secure an income before marrying, marry at an earlier age; the proportion of females married in any given age period is nearly the same as the proportion of males 5 or 10 years older who are married. The proportion of married reaches the maximum for females (79.2 per cent) between 35 and 44 years of age and for males (52.2 per cent) between 45 and 54. Wives become widows after 45 years of age more often than spinsters become wives, and after 65 years of age about three-fifths of the women are widows and one-third wives.

The influence of city life upon both sexes is to delay or prevent marriage.

When all ages are included, the white race is distinguished from the negro, Indian, and Mongolian by having a large proportion married and a small proportion single and widowed; but when children are omitted the proportion of single is larger and of widowed smaller among whites than among negroes or Indians, and the proportion of married among whites is greater than among negroes, but less than among Indians.
